Trend Analysis of Questions topicwise from CGL (Pre & Mains) CHSL (Pre & Mains) Selection Post VII, VIII, XI, SSC MTS, SSC GD & Other Exams (2017-2023)

01. ALGEBRA

(I) Problems based on Linear Equations

1. If 5x + 3y = 15 and 2xy = 6 then the value of 5x – 3y will be :

(a) $3\sqrt{5}$ (b) $3\sqrt{4}$
(c) $3\sqrt{3}$ (d) $3\sqrt{2}$

SSC CHSL (Tier-I) 02/08/2023 (Shift-I)

Ans. (a) : Given that-
$5x + 3y = 15,$
$2xy = 6$
$xy = 3$
∵ Formula-
$[(a - b)^2 = (a + b)^2 - 4ab]$
$(5x - 3y)^2 = (5x + 3y)^2 - 60xy$
$= (15)^2 - 60 \times 3$
$= 225 - 180$
$(5x - 3y) = \sqrt{45}$
$\therefore\ 5x - 3y = 3\sqrt{5}$

2. If $4x^2 + y^2 = 40$ and xy = 6 then find the value of 2x+y

(a) 4 (b) 8
(c) 6 (d) 5

SSC CGL (Mains) 06/03/2023

Ans. (b) : According to the question,
$\Rightarrow (2x + y)^2 = 4x^2 + y^2 + 2 \times 2x \times y$
$= 40 + 4 \times 6$
$\Rightarrow (2x + y)^2 = 64$
$\Rightarrow 2x + y = 8$

3. For what value of m will the system of equation 18x – 72y + 13 = 0 and 7x – my – 17 = 0 have no solutions ?

(a) 24 (b) 12
(c) 9 (d) 28

SSC CGL (Mains) 06/03/2023

Ans. (d) : According to the question,
$18x - 72y + 13 = 0$
and,
$7x - my - 17 = 0$
So, the given system of equation will have no solution, if
$$\frac{a_1}{a_2} = \frac{b_1}{b_2} \neq \frac{c_1}{c_2}$$
$$\frac{18}{7} = \frac{72}{m}$$
$\therefore$ $\boxed{m = 28}$

4. Simplify the problem $(3x + 2y)^2 - (3x - 2y)^2$.

(a) $9x^2 - 4y^2$ (b) 12xy
(c) $18x^2 - 8y^2$ (d) 24xy

SSC CHSL (Tier-I) 10/08/2023 (Shift-I)

Ans. (d) : $(3x + 2y)^2 - (3x - 2y)^2$
$(3x + 2y + 3x - 2y)(3x + 2y - 3x + 2y)$ $[\because a^2 - b^2 = (a + b)(a - b)]$
$= 6x \times 4y$
$= 24xy$

5. For what value of m will the system of equation 17x + my + 102 = 0 and 23x + 299y + 138 = 0 have infinite number of solutions ?

(a) 221 (b) 223
(c) 220 (d) 219

SSC CGL (Mains) 02/03/2023

Ans. (a) : According to the question,
$17x + my + 102 = 0$ and $23x + 299y + 138 = 0$
For infinite solutions,
$$\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$$
$$\Rightarrow \frac{17}{23} = \frac{m}{299} = \frac{102}{138}$$
$$\Rightarrow m = 17 \times \frac{299}{23}$$
$\Rightarrow m = 17 \times 13$
$\therefore\ m = 221$

6. If x + y + 3 = 0 then find the value of $x^3 + y^3 - 9xy + 9$

(a) 18 (b) –36
(c) 36 (d) –18

SSC MTS 01/09/2023 (Shift Ist)

Ans. (d) : Given,
$x + y + 3 = 0$
$x + y = -3$ ...... (i)
taking cube of both sides,
$x^3 + y^3 + 3xy(x+y) = -27$
$x^3 + y^3 + 3xy(-3) = -27$ {From Equation (i)}
$x^3 + y^3 - 9xy = -27$
On adding 9 in both sides−
$x^3 + y^3 - 9xy + 9 = -27+9$
$\boxed{x^3 + y^3 - 9xy + 9 = -18}$

7. **If $\frac{22\sqrt{2}}{4\sqrt{2}-\sqrt{3+\sqrt{5}}} = a+\sqrt{5}b$ where a, b > 0 then what is the value of (ab) : (a+b) ?**

(a) 7 : 8 (b) 4 : 7
(c) 7 : 4 (d) 8 : 7

SSC CGL (Tier-II) 29/01/2022 (Shift-I)

Ans. (a) : $\frac{22\sqrt{2}}{4\sqrt{2}-\sqrt{3+\sqrt{5}}} = a+\sqrt{5}\ b$

On multiplying and dividing by 2 in $\sqrt{(3+\sqrt{5})}$

$$= \frac{22\sqrt{2}}{4\sqrt{2}-\sqrt{\frac{2(3+\sqrt{5})}{2}}}$$

$$= \frac{22\sqrt{2}}{4\sqrt{2}-\sqrt{\frac{6+2\sqrt{5}}{2}}} \qquad (\because (a+b)^2 = a^2+b^2+2ab)$$

$\therefore \ (\sqrt{5}+1)^2 = 6+2\sqrt{5}$

$$= \frac{22\sqrt{2}}{4\sqrt{2}-\left(\frac{(\sqrt{5}+1)^0}{\sqrt{2}}\right)} = \frac{22\sqrt{2}\times\sqrt{2}}{8-\sqrt{5}-1}$$

$= \frac{44}{7-\sqrt{5}}$ (On Rationalizing, we get)

$$= \frac{44}{(7-\sqrt{5})}\times\frac{(7+\sqrt{5})}{(7+\sqrt{5})} = 7+\sqrt{5}$$

Comparing with $a+\sqrt{5}b$

a = 7, b = 1

Putting the value of a and b in ab : (a + b)

(7 × 1) : (7 + 1)

= 7 : 8

8. **What will be the solution of following system of linear equations?**

$3x-9y+4z=5$

$2x+7y+z=12$

$3x-z=0$

(a) $x=\frac{143}{150}, y=\frac{31}{30}, z=\frac{143}{51}$

(b) $x=\frac{143}{150}, y=\frac{31}{37}, z=\frac{143}{50}$

(c) $x=\frac{143}{150}, y=\frac{31}{30}, z=\frac{143}{50}$

(d) $x=\frac{137}{150}, y=\frac{31}{30}, z=\frac{143}{50}$

SSC Selection Posts XI-28/06/2023 (Shift-III)

Ans. (c) : According to the question,

$3x-9y+4z=5$ ....(i)

$2x+7y+z=12$ ....(ii)

$3x-z=0$........................(iii)

$x=\frac{z}{3}$

Putting the value of $x=\frac{z}{3}$ in eq^n (i) and (ii)

$3\times\frac{z}{3}-9y+4z=5$

$5z-9y=5$............(iv)

$2\times\frac{z}{3}+7y+z=12$

$5z+21y\pm 36$.........(v)

eq^n (iv) - eq^n (v), we get

30y = 31

$\boxed{y=\frac{31}{30}}$

Putting the value of $y=\frac{31}{30}$ in eq^n 5

$5z-9\times\frac{31}{30}=5$

$z=\frac{143}{50}$

Puitting the value of $z=\frac{143}{50}$ in eq^n iii, we get

$3x-\frac{143}{50}=0 \quad \Rightarrow x=\frac{143}{50}$

Hence, $x=\frac{143}{50},\ y=\frac{31}{30},\ z=\frac{143}{50}$

So, option (c) is correct.

9. **If 2a + b = 10 and 2ab = 9 then, the value of (2a – b) will be :**

(a) 10 (b) 4
(c) 8 (d) 6

SSC Selection Posts XI-28/06/2023 (Shift-III)

Ans. (c) : Given that, 2a + b = 10 and 2 ab = 9

According to the question,

$\because\ (a-b)=\sqrt{(a+b)^2-4ab}$

$\therefore (2a-b)=\sqrt{(2a+b)^2-8ab}$

$=\sqrt{100-36}$

$=\sqrt{64}$

$=8$

10. **If 2x + 3y – 5z = 18, 3x + 2y + z = 29 and x + y + 3z = 17, then what is the value of xy+yz+zx?**

(a) 32 (b) 52
(c) 64 (d) 46

SSC CGL (Tier-II) 21-02-2018

@apna_pdf

Ans. (b) : Given,

$2x + 3y - 5z = 18$ ...... (i)

$3x + 2y + z = 29$ ....(ii)

$x + y + 3z = 17$ .... (iii)

Multiplying by 5 in equation (ii) and adding it to equation (i),

$2x + 3y - 5z = 18$

$\underline{15x + 10y + 5z = 145}$

$17x + 13y = 163$ .... (iv)

Again, on multiplying by 3 in equation (ii) and subtracting it to equation (iii), we get-

$8x + 5y = 70$ .... (v)

By solving the equation (iv) and (v)

$x = 5, \quad y = 6$

On putting the value of x = 5 and y = 6 in equation (ii),

$15 + 12 + z = 29$

$\Rightarrow z = 2$

$\therefore xy + yz + zx = (5\times6) + (6\times2) + (2\times5)$

$= 30 + 12 + 10 = \boxed{52}$

11. If $a - b = 3$ and $a^3 - b^3 = 999$, then find the value of $a^2 - b^2$.

(a) 60 (b) 62

(c) 64 (d) 63

SSC CHSL 03/06/2022 (Shift- II)

Ans. (d) : $a - b = 3$

$a^3 - b^3 = 999$

$(a - b)[(a - b)^2 + 3ab] = 999$

$3[9 + 3ab] = 999$

$3ab = 333 - 9$

$ab = 108$

$(a + b)^2 = (a - b)^2 + 4ab$

$(a + b)^2 = 9 + 4 \times 108$

$(a + b)^2 = 441$

$a + b = 21$

$a^2 - b^2 = (a - b)(a + b)$

$= 3 \times 21 = 63$

12. If x, y, z are three integers such that x + y = 8, y + z = 13 and z + x = 17, then the value of $\frac{x^2}{yz}$ is:

(a) 1 (b) $\frac{18}{11}$

(c) 0 (d) $\frac{7}{5}$

SSC CGL (Tier-I)-2019–03/03/2020 (Shift-I)

Ans. (b) : Given, $x + y = 8$ .... (1)

$y + z = 13$ .... (2)

$z + x = 17$ .... (3)

On adding the equation (i), (ii), and (iii)

$2(x+y+z) = 38$-------(iv)

$x + y + z = 19$

$\therefore x = 6, y = 2, z = 11$

$\therefore \frac{x^2}{yz} = \frac{36}{22} = \frac{18}{11}$

13. If $3x + 6y + 9z = \frac{20}{3}$, $6x + 9y + 3z = \frac{17}{3}$ and $18x + 27y - z = \frac{113}{9}$, then what is the value of $75x + 113y$?

(a) 163/3 (b) 143/6

(c) 218/9 (d) 311/3

SSC CGL (Tier-II) 9-3-2018

Ans. (a) :

$3x + 6y + 9z = \frac{20}{3}$.......(1)

$6x + 9y + 3z = \frac{17}{3}$.......(2)

$18x + 27y - z = \frac{113}{9}$.......(3)

On Multiplying by 3 in equation (iii) and adding it in equation (ii),

$54x + 81y - 3z + 6x + 9y + 3z = \frac{113}{3} + \frac{17}{3}$

$60x + 90y = \frac{130}{3}$

$6x + 9y = \frac{13}{3}$.......(4)

Multiplying by 3 in equation (2) and substracting it from equation 1,

$3x + 6y + 9z - 18x - 27y - 9z = \frac{20}{3} - 17$

$-15x - 21y = \frac{-31}{3}$

$15x + 21y = \frac{31}{3}$........(5)

Multiply by 5 eq^n (4) and multiplying by 2 in eq^n (5), respectively then subtracting equation (4) from equation (5).

$30x + 45y = \frac{65}{3}$

$30x + 42y = \frac{62}{3}$

$\underline{- \quad - \quad -}$

$3y = 1$

$y = \frac{1}{3}$

From equation (4),

$6x + 3 = \frac{13}{3}$

$6x = \frac{13}{3} - 3$

$6x = \frac{4}{3}$

$x = \frac{2}{9}$

@apna_pdf

$\therefore 75x+113y=75\times\frac{2}{9}+113\times\frac{1}{3}$

$=\frac{50}{3}+\frac{113}{3}=\frac{163}{3}$

14. If 3x + 4y – 2z + 9 = 17, 7x + 2y + 11z + 8 = 23 and 5x + 9y + 6z – 4 = 18, then what is the value of x + y + z – 34 ?

(a) –28 (b) –14
(c) –31 (d) –45

SSC CGL (Tier-II) 20-02-2018

Ans. (c) : 3x + 4y – 2z + 9 = 17 .... (i)
7x + 2y + 11z + 8 = 23 .... (ii)
5x + 9y + 6z–4 = 18 ...... (iii)
By adding the equation (i), (ii) and (iii)
15x + 15y + 15z = 45
x +y + z = 3
$\therefore x+y+z-34$
= 3 – 34 = –31

16. If $x+3y-\frac{2z}{4}=6, x+\frac{2}{3}(2y+3z)=33$ and $\frac{1}{7}(x+y+z)+2z=9$, then what is the value of 46x + 131y ?

(a) 414 (b) 364
(c) 384 (d) 464

SSC CGL (Tier-II) 20-02-2018

Ans. (a) $x+3y-\frac{2z}{4}=6$
4x + 12y – 2z = 24 --------(i)
$x+\frac{2}{3}(2y+3z)=33$
3x + 4y + 6z = 99 ---------(ii)
$\frac{1}{7}(x+y+z)+2z=9$
x+y+z+14z = 63
x + y + 15z = 63 ---------(iii)
From Equation (i) × $\frac{21}{2}$ + Equation (ii) + Equation (iii),
42x+126y–21z+3x+4y+6z+x+y+15z=252+99+63
46x+131y= 414

16. If 3x + 4y –11 = 18 and 8x– 6y + 12 = 6, then what is the value of 5x–3y – 9?

(a) 18 (b) –9
(c) –27 (d) –18

SSC CGL (Tier-II) 19-02-2018

Ans. (b) : 3x + 4y = 29 ———— (i)
8x – 6y = – 6
4x – 3y = –3 ———— (ii)
On solving the equation (i) and (ii),
x = 3, y = 5
$\therefore 5x-3y-9=15-15-9=-9$

17. If a +b+c = 7/12, 3a – 4b + 5c = 3/4 and 7a–11b – 13c = –7/12 , then what is the value of a+c?

(a) 1/2 (b) 5/12
(c) 3/4 (d) 1/4

SSC CGL (Tier-II) 19-02-2018

Ans. (b) : $a+b+c=\frac{7}{12}$ ....(1)

$3a-4b+5c=\frac{3}{4}$ ....(2)

$7a-11b-13c=-\frac{7}{12}$ ....(3)

On multiplying by 4 in equation (1) then adding it in equation (2)

$4a+4b+4c+3a-4b+5c=\frac{7}{3}+\frac{3}{4}$

$7a+9c=\frac{37}{12}$ ....(4)

On multiplying by 11 in equation (1) then adding it in equation (3)

$11a+11b+11c+7a-11b-13c=\frac{77}{12}-\frac{7}{12}$

$18a-2c=\frac{35}{6}$

$9a-c=\frac{35}{12}$ ....(5)

On multiplying by 9 in equation (5) then adding it in equation (4),

$81a-9c+7a+9c=\frac{315}{12}+\frac{37}{12}$

$a^2+ab+b^2=\frac{999}{3}$

$a^2 + ab + b^2 = 333$

$a^2 + a(a - 3) + (a - 3)^2 = 333$ (By Eq^n (i))

$a^3 + b^3 + c^3 - 3abc = (a + b + c)[(a + b + c)^2 - 3(ab + bc + ca)]$

$a^3 + b^3 + c^3 - 3abc = 11(121 - 84)$

$a^3 + b^3 + c^3 - 3abc = 11 \times 37$

$a^3 + b^3 + c^3 - 3abc = 407$

$(a^2 + 2a + 1) + (b^2 - 2b + 1) + (49c^2 - 56c + 16) = 0$

$(a + 1)^2 + (b - 1)^2 + (7c - 4)^2 = 0$

(a) 531 (b) 7

(c) 623 (d) 527

SSC CGL (Tier-I) 18/04/2022 (Shift-III)

Ans. (d) From question,

$\sqrt{x} - \frac{1}{\sqrt{x}} = \sqrt{3}$

On squaring both sides,

$\left(\sqrt{x} - \frac{1}{\sqrt{x}}\right)^2 = \left(\sqrt{3}\right)^2$

$\Rightarrow x + \frac{1}{x} - 2 \times \sqrt{x} \times \frac{1}{\sqrt{x}} = 3$

$\Rightarrow x + \frac{1}{x} = 3 + 2$

$\Rightarrow x + \frac{1}{x} = 5$

Again, on squaring both sides

$\left(x + \frac{1}{x}\right)^2 = 5^2$

$x^2 + \frac{1}{x^2} + 2 = 25$

$\Rightarrow x^2 + \frac{1}{x^2} = 23$

Again, squaring on both sides

$\left(x^2 + \frac{1}{x^2}\right)^2 = (23)^2$

$\Rightarrow x^4 + \frac{1}{x^4} + 2 = 529$

$\therefore x^4 + \frac{1}{x^4} = 527$

(c) $\sqrt{17}$ (d) $\sqrt{21}$

SSC CGL (Tier-I) 18/04/2022 (Shift-II)

Ans. (a) $2\sqrt{2}x^3 - 3\sqrt{3}y^3 = \left(\sqrt{2}x - \sqrt{3}y\right)\left(Ax^2 - Bxy + Cy^2\right)$,

$\left(2x^2 + \sqrt{6}xy + 3y^2\right) = \left(Ax^2 - Bxy + Cy^2\right)$

On comparing,

$A = 2, B = -\sqrt{6}, C = 3$

$\sqrt{\left(A^2 + B^2 + C^2\right)} = \sqrt{2^2 + \left(-\sqrt{6}\right)^2 + (3)^2} = \sqrt{4 + 6 + 9} = \sqrt{19}$

$a = -1, b = 1, c = -4/7$

126. If $x^4+\frac{1}{x^4}=727$, x > 1, then what is the value of $\left(x-\frac{1}{x}\right)$?

(a) 6 (b) 5
(c) –5 (d) –6

SSC CGL–(Tier-I) 13/08/2021 (Shift III)

Ans. (b) : Given that– $x^4+\frac{1}{x^4}=727,\ x>1$

Adding 2 on both sides, $x^4+\frac{1}{x^4}+2=727+2$

$$\Rightarrow\left(x^2+\frac{1}{x^2}\right)^2=(27)^2$$

$$\Rightarrow x^2+\frac{1}{x^2}=27$$

Subtracting 2 from both sides,

$$x^2+\frac{1}{x^2}-2=27-2$$

$$\Rightarrow x^2+\frac{1}{x^2}-2\times x\times\frac{1}{x}=25$$

$$\Rightarrow\left(x-\frac{1}{x}\right)^2=5^2$$

Taking square root both sides,

$$\boxed{x-\frac{1}{x}=5}$$

Hence, option (b) is correct.

(a) 119 (b) –1
(c) 3 (d) 47

SSC CGL–(Tier-I) 13/08/2021 (Shift III)

Ans. (d) : From question,

$$x-\frac{1}{x}=1$$

On squaring both sides,

$$\left(x-\frac{1}{x}\right)^2=1^2$$

$$\Rightarrow x^2+\frac{1}{x^2}-2=1$$

$$\Rightarrow x^2+\frac{1}{x^2}=3$$

Again on squaring both sides,

$$\left(x^2+\frac{1}{x^2}\right)^2=3^2$$

$$\Rightarrow x^4+\frac{1}{x^4}+2=9,\ \Rightarrow x^4+\frac{1}{x^4}=7$$

Again on squaring both sides,

$$\left(x^4+\frac{1}{x^4}\right)^2=7^2$$

$$\Rightarrow x^8+\frac{1}{x^8}+2=49$$

$$\therefore \boxed{x^8+\frac{1}{x^8}=47}$$

On cubing both sides,

$$x^3+\frac{125}{8x^3}+3\times x\times\frac{5}{2x}\left(x+\frac{5}{2x}\right)=\frac{343}{8}$$

$$x^3+\frac{125}{8x^3}+\frac{15}{2}\times\frac{7}{2}=\frac{343}{8}$$

(a) –1 (b) –5

(c) 1 (d) 5

SSC CHSL 10/08/2021 (Shift-III)

Ans. (a) : Given :-

$a + b + c = 5, a^2 + b^2 + c^2 = 27$ and $a^3 + b^3 + c^3 = 125$

On squaring both sides of a + b + c = 5

$a^2 + b^2 + c^2 + 2(ab + bc + ca) = 25$

$2(ab + bc + ca) = 25 - 27 = -2$

$ab + bc + ca = \frac{-2}{2} = -1$ ----- (i)

Now from formula :

$a^3+b^3+c^3 - 3abc = (a + b + c) [(a+b+c)^2 - 3(ab+ bc+ca)]$

As per question

$a^3+b^3+c^3 - 3abc = 5 [(5)^2 - 3 (-1)]$

$125 - 3abc = 5 (25 + 3)$

$3abc = 125 - 140$

$abc = \frac{-15}{3} = -5$

On dividing by 5 both sides,

$\frac{abc}{5} = \frac{-5}{5} = -1$

$\boxed{\frac{abc}{5} = -1}$

180. If a + b + c = 11 and ab + bc + ca = 15 then what is the value of $a^3+b^3+c^3-3abc$?

(a) 368 (b) 386

(c) 638 (d) 836

SSC CHSL 10/08/2021 (Shift-III)

Ans. (d) : From formula :-

$a^3+b^3+c^3 - 3abc = (a+b+c) [(a+b+c)^2 - 3 (ab+bc+ca)]$

$a^3+b^3+c^3 - 3abc = 11 [(11)^2 - 3 (15)]$

$= 11 (121 - 45)$

$a^3+b^3+c^3 - 3abc = 11 \times 76 = 836$

$250 = 10 [(10)^2 - 3 (ab+bc+ca)]$

$100 - 3 (ab+bc+ca) = \frac{250}{10} = 25$

$3(ab+bc+ca) = 100 - 25 = 75$

203. If (3p – 5m) = 5 and pm = 6, then what is the value of $(9p^2 - 25m^2)$?

(a) $\pm 30\sqrt{10}$ (b) $30\sqrt{10}$
(c) $\pm 5\sqrt{385}$ (d) $5\sqrt{385}$

SSC CHSL 15/04/2021 (Shift-II)

Ans : (d) Given:- (3p – 5m) = 5, pm = 6

$(3p-5m)^2 + 4 \times 3p \times 5m = (3p+5m)^2$
$(5)^2 + 60 \times pm = (3p+5m)^2$
$(3p+5m)^2 = 25 + 360 = 385$
$3p + 5m = \sqrt{385}$ -------(i)

Now, $9p^2 - 25m^2 = (3p)^2 - (5m)^2$
$= (3p+5m)(3p-5m)$
$= \sqrt{365} \times 5$

Hence, $9p^2 - 25m^2 = 5\sqrt{385}$

$$x-\frac{1}{x}=3$$

On cubing both sides,

$361 = x^2 + y^2 + z^2 + 2 \times 114$

$361 - 228 = x^2 + y^2 + z^2$

$x^2 + y^2 + z^2 = 133$

$x^3+y^3+z^3-3xyz = (x+y+z)(x^2+y^2+z^2-xy-yz-zx)$

$\sqrt{x^3 + y^3 + z^3 - 3xyz} = \sqrt{19 \times 19}$

$\sqrt{x^3 + y^3 + z^3 - 3xyz} = 19$

(a) 6 (b) 5

(c) 3 (d) 4

SSC CGL (TIER-I)– 04.06.2019 (Shift-I)

Ans. (b) $x + y + z = 19$ ...... (i)

$x^2 + y^2 + z^2 = 133$ .... (ii)

$xz = y^2$ .... (iii)

$z - x = ?$

$(x+y+z) = 19$ (On squaring both sides)

$x^2 + y^2 + z^2 + 2xy + 2yz + 2xz = 361$

$133 + 2(xy + yz + zx) = 361$

$2(xy + yz + zx) = 361 - 133$

$xy + yz + xz = 114$

$xz = y^2$ (On putting the value) .... from equation (iii)

$xy + yz + y^2 = 114$

$y(x+y+z) = 114$ (x+y+z = 19 From equation (i))

$y \times 19 = 114$

$y = 6$

$y^2 = xz$

$36 = x \times z$

$36 = 4 \times 9$

$36 = 36$

Hence, we will put the value of x and z in such a way that the equation x + y + z = 19 is satisfied.

x = 4

y = 6

z = 9

$\therefore$ z – x = 9 – 4 = 5

OR

$x + y + z = 19$, $x^2 + y^2 + z^2 = 133$, $xz = y^2$, $z - x = ?$

Equation is satisfied from the value of x = 4, y = 6, z = 9

x + y + z = 19

4 + 6 + 9 = 19

19 = 19

$\therefore$ z – x = 9 – 4 = 5

Ans. (*) : $\because a^2 + b^2 – c^2 = 0$
$a^2 + b^2 = c^2$ ....(i)
On cubing both sides,
$(a^2 + b^2)^3 = c^6$
$a^6 + b^6 + 3a^2b^2 (a^2+b^2) = c^6$
$a^6 + b^6 – c^6 = – 3a^2b^2c^2$ ------------($\because a^2 + b^2 = c$)
$\frac{a^6+b^6-c^6}{3a^2b^2c^2} = -1$
On multiplying by 2 of both sides
$\frac{2(a^6+b^6-c^6)}{3a^2b^2c^2} = -2$

Note– SSC (Staff selection commission) has considered the answer to this question as 2, while the correct answer would be –2.

SSC CGL (Tier-I)-2019 – 09/03/2020 (Shift-I)

Ans. (c) : We know that formula:–

282. If x + y = 10 and xy = 4, then what is the value of $x^4 + y^4$?

(a) 8464 (b) 8432
(c) 7478 (d) 6218

SSC CGL (Tier-II) 21-02-2018

Ans. (b) : Given–
x + y = 10 ....(i)
xy = 4 .... (ii)
$\therefore x^4 + y^4 = (x^2 + y^2)^2 – 2x^2y^2$
$\therefore x^4 + y^4 = [(x+y)^2 – 2xy]^2 – 2 (xy)^2$ ....(iii)
By putting the value from equation (i) and (ii) in equation (iii)
$x^4 + y^4 = [(10)^2 – 2 \times 4]^2 – 2 \times (4)^2$
$= (92)^2 – 2 \times 16$

Ans. (b) : $a^3 + b^3 = 91$ ----------(i)
$b^3 + c^3 = 72$ ------------(ii)
$c^3 + a^3 = 35$ -----------(iii)
By adding
$2(a^3+ b^3 + c^3) = 198$
$a^3 + b^3 + c^3 = 99$
$\because a^3+b^3+c^3–3abc = (a+b+c) [(a+b+c)^2 –3(ab+bc+ca)]$

(c) $(-4\sqrt{3}-1)/4$ (d) $(-4\sqrt{3}-1)/2$

SSC CGL (Tier-II) 19-02-2018

(a) 96475 (b) 98625
(c) 92425 (d) 89125

SSC CGL (Tier-II) 18-02-2018

Ans. (b) : Given–

$A = \frac{x^8 - 1}{x^4 + 1}$ & $B = \frac{y^4 - 1}{y^2 + 1}$

From formula

$(a-b)(a+b) = a^2 - b^2$

By solving the equation A and B

$A = \frac{(x^4-1)(x^4+1)}{(x^4+1)}$ & $B = \frac{(y^2-1)(y^2+1)}{(y^2+1)}$

$A = (x^4-1)$ & $B = (y^2-1)$

If x = 2, & y = 9

Then–

$A = 2^4 - 1 = 15$

$B = 9^2 - 1 = 80$

By putting the value of A and B

$\Rightarrow A^2 + AB^2 + 2AB$

$\Rightarrow (15)^2 + 15 \times (80)^2 + 2 \times 15 \times 80$

Ans. (d) $x^6 - 512y^6 = (x^2 + Ay^2)(x^4 - Bx^2y^2 + Cy^4)$

$\Rightarrow (x^2)^3 - \left((2\sqrt{2}y)^2\right)^3 = (x^2 + Ay^2)(x^4 - Bx^2y^2 + Cy^4)$

(a) 730 (b) 319
(c) 322 (d) 780

SSC CHSL 10/07/2019 (Shift-II)

Ans. (c) : $a+\frac{1}{a}=3$

On squaring both,

$a^2+\frac{1}{a^2}=9-2=7$

On cubing both side,

$a^6+\frac{1}{a^6}=(7)^3-3\times7=343-21=322$

357. If $a+\frac{1}{a}=2$, then what is the value of $a^4-\frac{1}{a^4}$?

(a) $\frac{1}{4}$ (b) 4
(c) 1 (d) 0

SSC CHSL 10/07/2019 (Shift-I)

Ans. (d) : $a+\frac{1}{a}=2$

On squaring both side

$a^2+\frac{1}{a^2}=4-2=2$

If $a+\frac{1}{a}=k$, $a-\frac{1}{a}=\sqrt{k^2-4}$

$\therefore\ a^2-\frac{1}{a^2}=\sqrt{2^2-4}=0$

$\therefore\ a^4-\frac{1}{a^4}=\left(a^2+\frac{1}{a^2}\right)\left(a^2-\frac{1}{a^2}\right)=0$

OR

If $a+\frac{1}{a}=2 \Rightarrow a=1$

$\therefore a^4-\frac{1}{a^4}=1^4-\frac{1}{1^4}=0$

(c) 3xyz (d) $(x+y)(y+z)(z+x)$

SSC CHSL 10/07/2019 (Shift-I)

$(x+y)^{\frac{1}{3}}+(y+z)^{\frac{1}{3}}+(z+x)^{\frac{1}{3}}=0$

If $a+b+c=0 \Rightarrow a^3+b^3+c^3=3abc$

$\Rightarrow (x+y)+(y+z)+(z+x)=3(x+y)^{\frac{1}{3}}(y+z)^{\frac{1}{3}}(z+x)^{\frac{1}{3}}$

$\Rightarrow 2(x+y+z)=3(x+y)^{\frac{1}{3}}(y+z)^{\frac{1}{3}}(z+x)^{\frac{1}{3}}$

$\Rightarrow (x+y+z)=\frac{3}{2}(x+y)^{\frac{1}{3}}.(y+z)^{\frac{1}{3}}.(z+x)^{\frac{1}{3}}$

Again, on cubing both sides,

$$x^3+y^3+z^3+3(x+y)(y+z)(z+x)=\frac{27}{8}(x+y)(y+x)(z+x)$$

(d) $a^2x^3 + 2abx + b^2y^2x$

SSC CHSL –16/10/2020 (Shift-II)

Ans. (a) $\therefore ax + by = 0$

$ax = -by$

$x = -\frac{b}{a}y$

By putting the value of x in given equation. It should be equal to zero.

From option (a),

$\therefore a^2x^2 + 2abxy + b^2y^2 =$

$$a^2\left(-\frac{by}{a}\right)^2 + 2ab\left(-\frac{by}{a}\right)y + b^2y^2$$

$$= a^2\frac{b^2y^2}{a^2} - 2b^2y^2 + b^2y^2$$

$$= b^2y^2 - 2b^2y^2 + b^2y^2$$

$$= 2b^2y^2 - 2b^2y^2 = 0$$

Hence (ax+by) is the factor of equation $a^2x^2 + 2abxy + b^2y^2$

From option (a),

$a^2x^2 + 2abxy + b^2y^2$

439. If α and β are the roots of equation $x^2-2x+4=0$, then what is the equation whose roots are α^3/β^2 and β^3/α^2 ?

(a) $x^2 - 4x + 8 = 0$ (b) $x^2 - 32x + 4 = 0$
(c) $x^2 - 2x + 4 = 0$ (d) $x^2 - 16x + 4 = 0$

SSC CGL (Tier-II) 20-02-2018

Ans. (c) : α and β are the roots of $x^2 - 2x + 4 = 0$

$\therefore \alpha+\beta=-\frac{b}{a}=2$

$\alpha\beta=\frac{c}{a}=4$

$\alpha^3+\beta^3 = (2)^3 - 3\times4\times2 = -16$

$\alpha^2+\beta^2 = (2)^2 - 2\times4 = -4$

Sum −

$\frac{\alpha^3}{\beta^2}+\frac{\beta^3}{\alpha^2}=\frac{\alpha^5+\beta^5}{(\alpha\beta)^2}$

Product $= \alpha\beta = 4$

$(\alpha^3+\beta^3)(\alpha^2+\beta^2)=\alpha^5+\beta^5+\alpha^2\beta^2(\alpha+\beta)$

$-16\times(-4)=\alpha^5+\beta^5+16\times2$

$\alpha^5+\beta^5=32$

Hence, equation,

$x^2-\left(\frac{\alpha^5+\beta^5}{(\alpha\beta)^2}\right)x+\alpha\beta=0$

$x^2 - 2x + 4 = 0$

(c) $\frac{5}{2}$ (d) $\frac{\sqrt{13}}{2}$

SSC CGL (Tier-II) 29/01/2022

SSC CGL (Tier-I)-2019 – 06/03/2020 (Shift-I)

Ans. (b) : $3^a = 27^b = 81^c$

$3^a = 3^{3b} = 3^{4c}$

$a = 3b = 4c$

$a : b : c = 1 : \frac{1}{3} : \frac{1}{4} = 12 : 4 : 3$

Let, a = 12k, b = 4k, c = 3k

$\because$ abc = 144

$\therefore$ 12k × 4k × 3k = 144

$144k^3 = 144$

$k^3 = 1 \Rightarrow k = 1$

then, $a = 12k \Rightarrow 12 \times 1 = 12$

$b = 4k \Rightarrow 4 \times 1 = 4$

$c = 3k \Rightarrow 3 \times 1 = 3$

Hence $12\left(\frac{1}{a} + \frac{1}{2b} + \frac{1}{5c}\right)$

Ans. (a) : $(a + b - 2)^2 + (b + c - 5)^2 + (c + a - 5)^2 = 0$
It is possible only when
$a + b - 2 = 0, b + c - 5 = 0, c + a - 5 = 0$
then, $a + b = 2$
$b + c = 5$
$c + a = 5$
$2(a+b+c) = 12$
$a+b+c = 6$
$\therefore a = 1, b = 1, c = 4$

$a - b = \frac{1}{a}$ ------------(i)

$c - a = \frac{1}{c}$ ------------(iii)

From equation (i) × (ii) + equation (ii) × (iii) + equation (iii) × (i),

(b) $k = \pm\frac{1}{9}$

(c) $k = \pm\frac{1}{21}$

(d) $k = \pm\frac{1}{18}$

SSC CHSL 10/06/2022 (Shift- II)

Ans. (d) : From question,

$p + \frac{1}{9}\sqrt{p} + k^2$

Formula -

$(x + y)^2 = x^2 + 2xy + y^2$

Where, $x^2 = p$, $y^2 = k^2$

$\Rightarrow x = \sqrt{p}$ $\Rightarrow y = k$

$\therefore (\sqrt{p})^2 \pm 2\times\sqrt{p}\times k + k^2$

On taking, $\pm 2\sqrt{p}k = \frac{1}{9}\sqrt{p}$

$$k = \pm\frac{1}{18}$$

(a) b^2 (b) $1/b^2$

(c) a^2 (d) a^2b^2

SSC MTS 9-10-2017 (Shift-I)

Ans : (b) $\left[\left(a^{-2}b^3\right) \div \left(a^1b^{-1}\right)\right] \times \left[\left(a^2b^{-4}\right) \div \left(a^{-1}b^2\right)\right]$

$$= \left[\left(\frac{b^3}{a^2}\right) \div \left(\frac{a}{b}\right)\right] \times \left[\left(\frac{a^2}{b^4}\right) \div \left(\frac{b^2}{a}\right)\right]$$

$$= \left[\frac{b^3 \times b}{a^2 \times a}\right] \times \left[\frac{a^2 \times a}{b^4 \times b^2}\right]$$

$$= \frac{b^4}{a^3} \times \frac{a^3}{b^6}$$

$$= \frac{1}{b^2}$$

02. Trigonometry

(I) Problems based on Trigonometric Ratios

1. If tan3θ.tan7θ = 1, where 7θ is an acute angle, then find the value of cot15θ.

(a) $-\sqrt{3}$ (b) 1
(c) –1 (d) $\sqrt{3}$

SSC MTS 03/05/2023 (Shift IInd)

Ans. (c) : tan3θ.tan7θ = 1 (where 7θ is an acute angle)

$\tan 7\theta = \cot 3\theta$
$\tan 7\theta = \tan(90° - 3\theta)$
$7\theta = 90° - 3\theta$
then $(3\theta + 7\theta) = 90°$
$10\theta = 90°$
$\theta = 9°$
then $\cot 15\theta$
$\cot (15\times9)°$
$= \cot 135°$
$= \cot (90\times1+45°) = -\tan 45°$
$= -1$

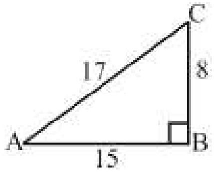
2. If $\sin\theta = \frac{8}{17}$ then find the value of tanθ.

(a) $\frac{17}{15}$ (b) $\frac{8}{15}$
(c) $\frac{15}{17}$ (d) $\frac{15}{8}$

SSC CGL 05/12/2022 (Shift-I)

Ans. (b) : $\sin\theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}}$

$\sin\theta = \frac{8}{17}$



$AB = \sqrt{17^2 - 8^2}$
$= \sqrt{289 - 64}$
$= \sqrt{225} = 15$

$\tan\theta = \frac{P}{B}$

Hence $\tan\theta = \frac{BC}{AB} = \frac{8}{15}$

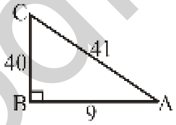
3. If $\cos A = \frac{9}{41}$, then find the value of cotA.

(a) $\frac{41}{40}$ (b) $\frac{9}{40}$
(c) $\frac{40}{9}$ (d) $\frac{9}{41}$

SSC CGL 01/12/2022 (Shift-IV)

Ans. (b) : Given that

$\cos A = \frac{9}{41}$ $\left(\because \cos A = \frac{\text{Base}}{\text{Hypotenuse}}\right)$



$BC = \sqrt{41^2 - 9^2}$
$= \sqrt{1681 - 81} = 40$
$\cot A = \frac{\text{Base}}{\text{Perpendicular}} = \frac{9}{40}$

4. If $\cot A = \frac{15}{8}$ then get the value of tan2A will be?

(a) 240/173 (b) 240/161
(c) 220/171 (d) 200/161

SSC CGL 06/12/2022 (Shift-II)

Ans. (b) : According to question,

$\cot A = \frac{15}{8}$

then $\tan A = \frac{8}{15}$ $\quad \cot A = \frac{1}{\tan A}$

$\tan 2A = \frac{2\tan A}{1 - \tan^2 A}$

$= \frac{2\times\frac{8}{15}}{1 - \frac{64}{225}}$

$= \frac{16\times225}{15\times161} = \frac{240}{161}$

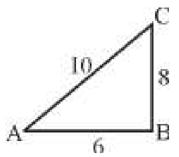
5. If 8cotθ = 6 then find the value of $\frac{\sin\theta + \cos\theta}{\sin\theta - \cos\theta}$.

(a) 7 (b) 2
(c) 5 (d) 12

SSC MTS 01/09/2023 (Shift I[st])

@apna_pdf

Ans. (a) :



$8 \cot\theta = 6$

$\cot\theta = \frac{B}{P} = \frac{6}{8}$

$AC^2 = 6^2 + 8^2$

$AC = \sqrt{100}$

AC = 10

Hence,

$$\frac{\sin\theta + \cos\theta}{\sin\theta - \cos\theta}$$

$$= \frac{\frac{8}{10} + \frac{6}{10}}{\frac{8}{10} - \frac{6}{10}}$$

$$= \frac{14}{10} \times \frac{10}{2}$$

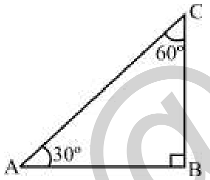
= 7

6. ΔABC is a Right angle triangle. If ∠B = 90° and tanA = $\frac{1}{\sqrt{3}}$ then find the value of (sinA cosC + cosA.sinC).

(a) $\frac{1}{3}$ (b) $\frac{2}{3}$ (c) 2 (d) 1

SSC CGL (Tier-I) 26/07/2023 (Shift-II)

Ans. (d) :



$\tan A = \frac{1}{\sqrt{3}}$

tanA = tan30º

A = 30º

∠B = 90º then ∠C = 180º – (∠A + ∠B) = 180º – (90º + 30º) = 60º

sinA.cosC+cosA.sinC = sin30º.cos60º+cos30º.sin60º

$$= \frac{1}{2} \times \frac{1}{2} + \frac{\sqrt{3}}{2} \times \frac{\sqrt{3}}{2} = \frac{1}{4} + \frac{3}{4}$$

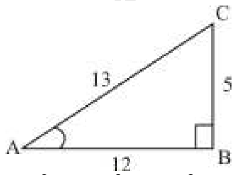
$$= \frac{1+3}{4} = 1$$

7. If tanA = $\frac{5}{12}$ then the value of cosA is :

(a) $\frac{5}{13}$ (b) $\frac{13}{5}$ (c) $\frac{12}{13}$ (d) $\frac{12}{5}$

SSC CGL 05/12/2022 (Shift-IV)

Ans. (c) : $\tan A = \frac{5}{12}$ (given that)



$AC^2 = AB^2 + BC^2$

$= (12)^2 + (5)^2$

$= \sqrt{144 + 25} = \sqrt{169}$

AC = 13

then

$\cos A = \frac{B}{H} = \frac{12}{13}$

8. If secθ – 2cosθ = $\frac{7}{2}$, where θ is positive acute angle, then the value of secθ is.

(a) 5 (b) 6
(c) 4 (d) 8

SSC CGL 06/12/2022 (Shift-IV)

Ans. (c) : $\sec\theta - 2\cos\theta = \frac{7}{2}$

$\Rightarrow \sec\theta - 2\cos\theta = \frac{7}{2}$ $\left[\because \sec\theta = \frac{1}{\cos\theta}\right]$

$\Rightarrow \frac{1}{\cos\theta} - 2\cos\theta = \frac{7}{2}$

$\Rightarrow \frac{1 - 2\cos^2\theta}{\cos\theta} = \frac{7}{2}$

$\Rightarrow 2 - 4\cos^2\theta = 7\cos\theta$

$\Rightarrow 4\cos^2\theta + 7\cos\theta - 2 = 0$

$\Rightarrow 4\cos^2\theta + 8\cos\theta - \cos\theta - 2 = 0$

$\Rightarrow 4\cos\theta(\cos\theta + 2) - 1(\cos\theta + 2) = 0$

$\Rightarrow (\cos\theta + 2)(4\cos\theta - 1) = 0$

$4\cos\theta - 1 = 0$

$\cos\theta = \frac{1}{4}$

∴ secθ = 4

9. Find the accurate value of cos 120º

SSC CGL (Mains) 06/03/2023

Ans. (b) : According to question,

cos 120º = cos (180º – 60º) = – cos 60º = $\left(\frac{-1}{2}\right)$ = – 0.5

10. If sinθ = $\frac{9}{41}$, and 0° <θ<90°, then the value of cotθ is :

$$= \sqrt{1-\left(\frac{9}{41}\right)^2}$$

$$= \sqrt{\frac{1681-81}{1681}} = \frac{40}{41}$$

$$\therefore \cot\theta = \frac{\cos\theta}{\sin\theta} = \frac{\frac{40}{41}}{\frac{9}{41}} = \frac{40}{9}$$

$$\cos\theta = \frac{1}{\sqrt{3}}$$

$$\sin\theta = \sqrt{1-\cos^2\theta}$$

Now,

$$\cos\theta = \sqrt{1 - \sin^2\theta}$$

$$\Rightarrow \cos\theta = \sqrt{1 - \left(\frac{15}{17}\right)^2} \Rightarrow \cos\theta = \sqrt{\frac{289 - 225}{289}}$$

$$\Rightarrow \sin^2\theta + \cos^2\theta + 2\sin\theta.\cos\theta = \frac{1}{29} \times \frac{1}{29}$$

$$\Rightarrow 1 + \sin 2\theta = \frac{1}{841}$$

$(\sin^2\theta + \cos^2\theta = 1 \; \& \; \sin 2\theta = 2\sin\theta.\cos\theta)$

$$\Rightarrow \sin 2\theta = \frac{1}{841} - 1$$

$$\Rightarrow \sin 2\theta = \frac{-840}{841}$$

Now, $(\sin\theta - \cos\theta)^2 = (\sin\theta + \cos\theta)^2 - 4\sin\theta\cos\theta$

$$\Rightarrow (\sin\theta - \cos\theta)^2 = \left(\frac{1}{29}\right)^2 - 2\sin 2\theta$$

$$\Rightarrow (\sin\theta - \cos\theta)^2 = \frac{1681}{841}$$

$$\Rightarrow \sin\theta - \cos\theta = \frac{41}{29}$$

Ans. (b) :

$7\sin^2\theta + 4\cos^2\theta = 5$

$3\sin^2\theta + 4\sin^2\theta + 4\cos^2\theta = 5$

$3\sin^2\theta + 4 = 5 \quad (\because \sin^2\theta + \cos^2\theta = 1)$

$3\sin^2\theta = 1$

$\sin\theta = \frac{1}{\sqrt{3}} = \frac{P}{H}$

By Pythagoras theorem,

$H^2 = P^2 + B^2$

$3 - 1 = B^2$

$B = \sqrt{2}$

$\therefore \frac{\sqrt{3}\sec\theta + \tan\theta}{\sqrt{2}\cot\theta - \sqrt{3}\cos\theta} = \frac{\sqrt{3}\times\frac{\sqrt{3}}{\sqrt{2}} + \frac{1}{\sqrt{2}}}{\sqrt{2}\times\frac{\sqrt{2}}{1} - \sqrt{3}\times\frac{\sqrt{2}}{\sqrt{3}}}$

$= \frac{\frac{4}{\sqrt{2}}}{2-\sqrt{2}} = \frac{2\sqrt{2}}{2-\sqrt{2}}$

$= \frac{2\sqrt{2}(2+\sqrt{2})}{(2-\sqrt{2})(2+\sqrt{2})} = \frac{2\sqrt{2}(2+\sqrt{2})}{2}$

(a) $\frac{1}{3}$ (b) $-\frac{1}{9}$ (c) $\frac{1}{9}$ (d) $-\frac{1}{3}$

SSC CPO SI 11/11/2022 (Shift IIIrd)

Ans. (c) : $\frac{\text{cosec}\theta + \cot\theta}{\text{cosec}\theta - \cot\theta} = \frac{7}{1}$

$7\text{cosec}\theta - 7\cot\theta = \text{cosec}\theta + \cot\theta$

$6\,\text{cosec}\theta = 8\cot\theta$

$6\times\frac{1}{\sin\theta} = 8\times\frac{\cos\theta}{\sin\theta}$

$6 = 8\cos\theta$

$\cos\theta = \frac{3}{4}$

$\sin\theta = \sqrt{1-\cos^2\theta} = \sqrt{1-\frac{9}{16}} = \frac{\sqrt{7}}{4}$

So, $\frac{4\sin^2\theta - 1}{4\sin^2\theta + 5} = \frac{4\times\frac{7}{16} - 1}{4\times\frac{7}{16} + 5}$

$\therefore \cos\theta = \sqrt{1 - \sin^2\theta}$

$$\Rightarrow \cos\theta = \sqrt{1-\left(\frac{43}{47}\right)^2}$$

$$\Rightarrow \cos\theta = \sqrt{\frac{360}{47\times 47}}$$

$$\Rightarrow \cos\theta = \frac{6\sqrt{10}}{47}$$

So, $\cot\theta = \frac{\cos\theta}{\sin\theta} = \frac{6\sqrt{10}/47}{43/47} = \frac{6\sqrt{10}}{43}$

(a) $\frac{4}{5}$ (b) $\frac{3}{5}$ (c) $\frac{5}{3}$ (d) $\frac{5}{4}$

SSC CHSL (Tier-I) 03/08/2023 (Shift-II)

Ans. (c) : $\cot B = \frac{15}{8}$

$$\tan B = \frac{1}{\cot B} = \frac{1}{15/8}$$

$\Rightarrow \tan B = 8/15$

We know that,

$$\sec B = \sqrt{1+\tan^2 B}$$

$$\Rightarrow \sec B = \sqrt{1+(8/15)^2}$$

$$\Rightarrow \sec B = \sqrt{\frac{225+64}{225}}$$

$$\Rightarrow \sec B = \frac{17}{15}$$

So, $\sec B + \tan B = \frac{17}{15} + \frac{8}{15} = \frac{25}{15}$

(a) 0 (b) 60

SSC CGL (Tier-I) 12/04/2022 (Shift-III)

Ans.(b) From question,

$\tan^2 A + 5\sec A = 13,\ 0^o < A < 90^o$

$\Rightarrow \frac{\sin^2 A}{\cos^2 A} + \frac{5}{\cos A} = 13$

$\left\{\because \tan A = \frac{\sin A}{\cos A}, \sec A = \frac{1}{\cos A}\right\}$

$\frac{\sin^2 A + 5\cos A}{\cos^2 A} = 13$

$\sin^2 A + 5\cos A = 13\cos^2 A$

$(1 - \cos^2 A) + 5\cos A - 13\cos^2 A = 0$

$\{\because \sin^2 A + \cos^2 A = 1\}$

$-14\cos^2 A + 5\cos A + 1 = 0$

$14\cos^2 A - 5\cos A - 1 = 0$

$14\cos^2 A - (7 - 2)\cos A - 1 = 0$

$14\cos^2 A - 7\cos A + 2\cos A - 1 = 0$

$7\cos A(2\cos A - 1) + 1(2\cos A - 1) = 0$

$(2\cos A - 1)(7\cos A + 1) = 0$

$\therefore 2\cos A - 1 = 0$

$\Rightarrow 2\cos A = 1$

$\Rightarrow \cos A = \frac{1}{2}$

$\Rightarrow \cos A = \cos 60^o$

$A = 60^o$

Short Method :

By option (b),

$A = 60^o$

$\tan^2 60^o + 5\sec 60^o = 13$

$\Rightarrow (\sqrt{3})^2 + 5 \times 2 = 13$

$\Rightarrow 3 + 10 = 13,\ \boxed{13 = 13}$

Hence, option (b) is correct.

(a) π (b) 0 (c) $\frac{\pi}{2}$ (d) $\frac{\pi}{4}$

SSC CHSL –17/03/2020 (Shift-II)

Ans. (d) : $(\sin\theta + \cos\theta)^2 = 2$

By putting the value $\theta = \frac{\pi}{4}$

$$\left(\sin\frac{\pi}{4}+\cos\frac{\pi}{4}\right)^2 = \left(\frac{1}{\sqrt{2}}+\frac{1}{\sqrt{2}}\right)^2$$

(a) $\frac{9}{4}$ (b) $\frac{5}{4}$ (c) $\frac{3}{4}$ (d) $\frac{7}{4}$

SSC CGL–(Tier-I) 13/08/2021 (Shift II)

Ans. (d) : Given, $2\cos^2\theta = 3\sin\theta$, $0^o < \theta < 90^o$

Put, $\theta = 30^o$

$2\times\frac{3}{4} = 3\times\frac{1}{2}$

$\frac{3}{2} = \frac{3}{2}$

$(\sec^2\theta - \tan^2\theta + \cos^2\theta)$

$[\because \sec^2 - \tan^2\theta = 1]$

$\therefore 1 + \cos^2 30$

$= \left[1 + \frac{3}{4}\right]$

$= \frac{7}{4}$

473. If $\cos\theta = \frac{\sqrt{3}}{2}$, then the value of $\frac{2 - \sin^2\theta}{1 - \cot^2\theta} + (\sec^2\theta + \operatorname{cosec}\theta)$ is:

SSC CHSL 05/08/2021 (Shift-I)

Ans. (b) : $\cos\theta = \frac{\sqrt{3}}{2}$ --------------[Given]

$\cos\theta = \cos 30°$

$\theta = 30°$

$\frac{2 - \sin^2\theta}{1 - \cot^2\theta} + (\sec^2\theta + \operatorname{cosec}\theta)$

@apna_pdf

$$= \frac{2-\left(\frac{1}{2}\right)^2}{1-\left(\sqrt{3}\right)^2} + \left(\frac{2}{\sqrt{3}}\right)^2 + 2$$

$$= \frac{2-\frac{1}{4}}{1-3} + \frac{4}{3} + 2$$

$$= -\frac{7}{4\times 2} + \frac{4}{3} + 2$$

$$= \frac{-21+32+48}{24} = \frac{59}{24}$$

474. If tan x = cot (48º + 2x), and 0º < x < 90º, then what is the value of x?

(a) 12º (b) 14º
(c) 16º (d) 21º

SSC CHSL 05/08/2021 (Shift-I)

Ans. (b) : tan x = cot (48° + 2x) (0°<x<90°)

tan x = cot (2x+48°)

cot (90°–x) = cot (2x+48°)

On comparing the both side

90°–48° = 2x + x

3x = 42°

x = 14°

475. If cos53º $= \frac{x}{y}$, then sec 53º + cot 37º is equal to:

(a) $\frac{x+\sqrt{y^2-x^2}}{y}$ (b) $\frac{x+\sqrt{y^2-x^2}}{x}$

(c) $\frac{y+\sqrt{y^2-x^2}}{x}$ (d) $\frac{y+\sqrt{y^2-x^2}}{y}$

SSC CGL (Tier-I) 19/04/2022 (Shift-II)

$\sin 53^o = \sqrt{1-\cos^2 53^o}$

$= \sqrt{1-\frac{x^2}{y^2}}$

(a) 90º (b) 30º

tanx (tanx–2) –1 (tanx – 2) = 0

(c) 15° (d) 60°

SSC CHSL 11/082021 (Shift-II)

Ans. (d) : 3cosecθ + 4sinθ – $4\sqrt{3}$ = 0

Let, θ= 60º

L.H.S = 3cosecθ + 4sinθ– $4\sqrt{3}$

$= 3\times\frac{2}{\sqrt{3}} + 4\times\frac{\sqrt{3}}{2} - 4\sqrt{3}$

(a) $\frac{1}{3}$ (b) 1

(c) $\frac{1}{2}$ (d) $\frac{1}{4}$

$\sin\theta - \cos\theta = 0$

$\sin\theta = \cos\theta$

$\sin\theta = \sin(90^0 - \theta)$

$\theta = 90^0 - \theta$

$\theta = 45^0$

Hence $\sin^4\theta + \cos^4\theta = \sin^4 45^0 + \cos^4 45^0$

$\frac{2\cos\theta}{\cos^2\theta} = 4$

$\cos\theta = \frac{1}{2} = \cos 60^0$

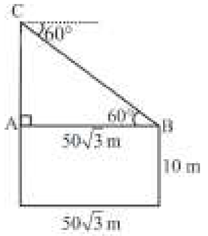
Height and Distance

1. From the top of a tower, the angle of depression of the top of a 10m high building is 60°. If the distance between the tower and the building is $50\sqrt{3}$, then find the height of that tower.

(a) 160 m (b) 140 m
(c) 150 m (d) 100 m

SSC CGL Mains 26/10/2023

Ans. (a) : According to the question,



In ΔABC

$$\tan 60° = \frac{AC}{AB}$$

$$\sqrt{3} = \frac{AC}{50\sqrt{3}}$$

AC = 150m

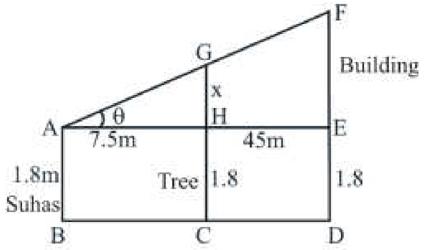
Hence, Total height of the tower = (150 + 10) = 160m

2. Suhas, a tree and a building 11.25m high are standing in such a way that their feet are in a line on the ground and the tree is in between suhas and the building. The tree is 7.5 away from suhas and 45m away from the building and the tree is situated at a distance of 7.5m from Suhas and at a distance of 45m from the building. Also, Suhas's eyes, the top of the tree and top of the building are in the same line, and Suhas's eyes are at a height of 1.8m from the ground. Find the height of the tree (in m).

(a) 3.00 (b) 3.30
(c) 3.45 (d) 3.15

SSC CHSL (Tier-I) 17/08/2023 (Shift-II)

Ans. (d) : According to the question,



Let, GH = x meters

In ΔAGH, $\tan\theta = \frac{x}{7.5}$............(i)

In ΔAEF, $\tan\theta = \frac{11.25 - 1.8}{7.5 + 45}$

$$\tan\theta = \frac{9.45}{52.5}\text{...............(ii)}$$

From equation (i) and equation (ii),

$$\frac{x}{7.5} = \frac{9.45}{52.5}$$

$$x = \frac{9.45 \times 7.5}{52.5}$$

x = 1.35 m

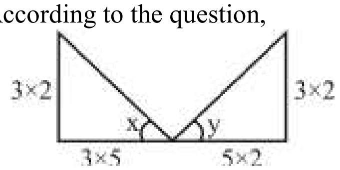
Hence, height of the tree (CG) = GH + HC
= 1.35+ 1.8
= 3.15 m

3. Two pillars of equal height are installed on both sides of a 150m wide road, Between these pillars, the angles of elevation of the pillers from a point on the road are x° and y° such that $\tan x° = \frac{2}{5}$, $\tan y° = \frac{3}{5}$, each pillars height will be:

(a) 42 m (b) 36 m
(c) 39 m (d) 33 m

SSC CGL Mains 26/10/2023

Ans. (b) : According to the question,



Let, Each pillar height = L.C.M of (2, 3)

∴ 6 → 36m

4. Suhas, a 3.15m tall tree, and a 11.25m high building are situated in such a way that their feet are on the ground and the tree lies between Suhas and the building. The tree is situated at a distance of 45m from the building. Further, Suhas's eyes, the top of the tree and the top of the building are in the same line and Suhas's eyes are at a height of 1.8m from the ground. (a) 6 (b) 5
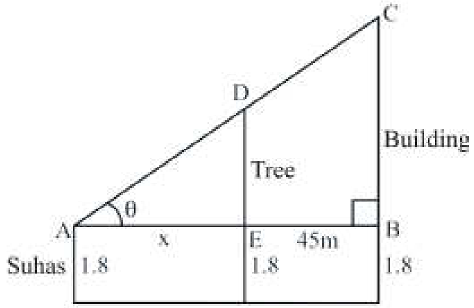
(c) 7.5 (d) 9

SSC CHSL (Tier-I) 02/08/2023 (Shift-I)

Ans. (c) : Let the tree be at a distance x m from Suhas.

In right angle ΔADE,

$\tan\theta = \frac{3.15 - 1.8}{x}$ $\left(\because \tan\theta = \frac{\text{Perpendicular}}{\text{Base}}\right)$



$\tan\theta = \frac{1.35}{x}$.........(i)

In right angle ΔABC

$\tan\theta = \frac{11.25 - 1.8}{x+45} = \frac{9.45}{x+45}$.........(ii)

From equations. (i) and (ii)

$\frac{1.35}{x} = \frac{9.45}{x+45}$

$\frac{135}{x} = \frac{945}{x+45}$

$\frac{1}{x} = \frac{7}{x+45}$

$7x - x = 45$

$6x = 45 \quad \Rightarrow x = 7.5m$

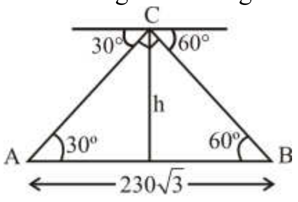
(a) 175.4 (b) 165.2
(c) 172.5 (d) 180.5

SSC CGL (Mains) 02/03/2023

Ans. (c): Let h be the height of the light house



In ΔABC,

$\sin 30 = \frac{BC}{230\sqrt{3}}$

$BC = 115\sqrt{3}$

$\sin 60 = \frac{AC}{230\sqrt{3}}$

AC =345

$h = \frac{AC \times BC}{AB} = \frac{115 \times 3 \times 115\sqrt{3}}{230\sqrt{3}} = 1.5 \times 115 = 172.5$

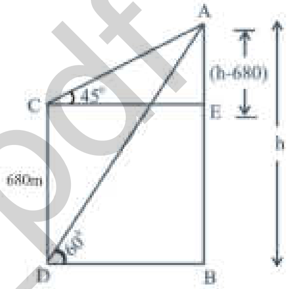
Hence the height of the light house is 172.5

6. **The angle of elevation of the top of a tower from the top of a 680 meter high building is 45° and the angle of elevation of the top of that tower from the base of the same building is 60°. What is the height (in meters) of the tower?**

(a) 310(3 + √3) (b) 340(3 – √3)
(c) 340(3 + √3) (d) 310(3 – √3)

SSC CGL Mains (Tier-II) 07/03/2022

Ans. (c) : Let the height of the tower be h m



In ΔABD,

$\tan 60^\circ = \frac{h}{BD}$

$\sqrt{3} = \frac{h}{BD}$

$BD = \frac{h}{\sqrt{3}}$

In ΔAEC,

$\tan 45^\circ = \frac{h - 680}{CE}$ $[\because BD = CE]$

$1 = \frac{h-680}{BD}$

$\frac{h}{\sqrt{3}} = h - 680$

$h = \sqrt{3}h - 680\sqrt{3}$

$\frac{680\sqrt{3}}{\sqrt{3}-1} = h$

$h = \frac{680\sqrt{3}\left(\sqrt{3}+1\right)}{2} = 340(3+\sqrt{3})$ m

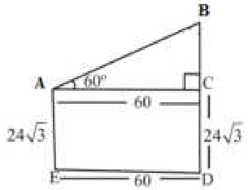
8. From the top of an upright pole $24\sqrt{3}$ feet high, the angle of elevation of the top of an upright tower was 60°. If the foot of the pole was 60 feet away from the foot of the tower, what was the height (in feet) tower?

(a) $60\sqrt{3}$ (b) $36\sqrt{3}$

(c) $84\sqrt{3}$ (d) $44\sqrt{3}$

SSC CGL (Mains) 06/03/2023

Ans. (c) : According to the question,



From the ΔACB,

$\tan 60° = \dfrac{BC}{60}$

$\sqrt{3} = \dfrac{BC}{60}$

$BC = 60\sqrt{3}$

Height of the lower $= 60\sqrt{3} + 24\sqrt{3} = 84\sqrt{3}$ feet.

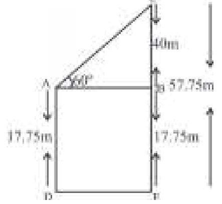
9. From the top of an upright pole 17.75m high, the angle of elevation of the top of an upright tower was 60°. If the tower was 57.75m high, how far away (in m) from the foot of the pole was the foot of the tower?

(a) $\dfrac{77}{4}\sqrt{3}$ (b) $\dfrac{151\sqrt{3}}{6}$

(c) $\dfrac{40\sqrt{3}}{3}$ (d) $40\sqrt{3}$

SSC CGL (Mains) 03/03/2023

Ans. (c) According to the question,



From the ΔABC

$\tan 60° = \dfrac{\text{Perpendicular}}{\text{Base}}$

$\sqrt{3} = \dfrac{40}{AB}$

$AB = \dfrac{40}{\sqrt{3}}$

$AB = \dfrac{40\sqrt{3}}{3}$

Hence, the foot of the tower was at a distance of 30m from the foot of the pole $= \dfrac{40\sqrt{3}}{3}$ m

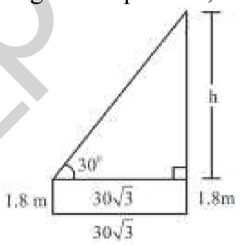
10. An person 1.8 metre tall is $30\sqrt{3}$ metre away from a tower. If the angle of elevation from his eye to the top of the tower is 30°, then what is the height (in m) of the tower?

(a) 30.5 (b) 32.5

(c) 37.8 (d) 31.8

SSC CGL (Tier-II) 08/08/2022 (Shift-I)

Ans. (d) : According to the question,



$\tan 30^0 = \dfrac{h}{30\sqrt{3}}$

$\dfrac{1}{\sqrt{3}} = \dfrac{h}{30\sqrt{3}}$

$h = 30m$

$\therefore$ Height of the tower $= 30 + 1.8 = 31.8$ m

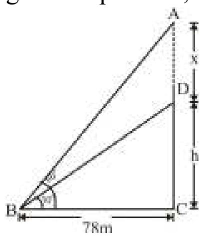
11. The angle of elevation of the top of an unfinished tower at a point distant 78m from base is 30°. How much higher must the tower be raised (in m) so that the angle of elevation of the top of the finished tower at the same point will be 60°?

(a) 80 (b) $78\sqrt{3}$

(c) $26\sqrt{3}$ (d) $52\sqrt{3}$

SSC CGL 11/04/2022 (Shift-I)

Ans. (d): According to the question,



In ΔDBC,

@apna_pdf

$$\tan 30^0 = \frac{DC}{BC}$$

$$\frac{1}{\sqrt{3}} = \frac{h}{78}$$

$$h = \frac{78}{\sqrt{3}} \times \frac{\sqrt{3}}{\sqrt{3}} = 26\sqrt{3}$$

Let the height of the tower will be raised (AD) = x m

In ΔABC,

$$\tan 60° = \frac{AC}{BC}$$

$$\sqrt{3} = \frac{CD + AD}{78}$$

$$\sqrt{3} = \frac{26\sqrt{3} + x}{78} \Rightarrow 78\sqrt{3} = 26\sqrt{3} + x$$

$$\boxed{x = 52\sqrt{3}m}$$

$\therefore$ The tower will be raised $52\sqrt{3}$ m.

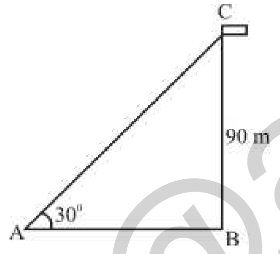
12. A kite is attached to a string. Find the length of the string (in m) when the height of the kite is 90m and the string makes an angle of 30° with the ground.

(a) 45 (b) 180

(c) $60\sqrt{3}$ (d) $90\sqrt{3}$

SSC CGL 11/04/2022 (Shift-III)

Ans. (b) : According to the question,



The height of the kite (BC) = 90 m

$$\sin\theta = \frac{BC}{AC}$$

$$\sin 30^0 = \frac{90}{AC}$$

$$\frac{1}{2} = \frac{90}{AC}$$

$$\boxed{AC = 180m}$$

Hence the length of the string is 180 m.

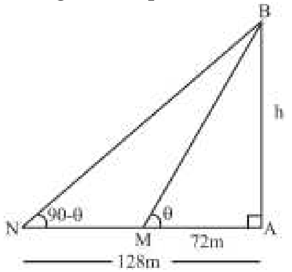
(a) 96 (b) 90

(c) 80 (d) 84

SSC CGL 12/04/2022 (Shift-II)

Ans. (a) : According to the question,



Let, the height of the building be h meter

In ΔBMA

$$\tan\theta = \frac{AB}{AM} = \frac{h}{72}$$

$$\tan\theta = \frac{h}{72} \text{........(i)}$$

In ΔBNA ,

$$\tan(90-\theta) = \frac{h}{128}$$

$$\cot\theta = \frac{h}{128}$$

$$\frac{1}{\cot\theta} = \frac{1}{h/128}$$

$$\tan\theta = \frac{128}{h} \text{.........(ii)}$$

From the equation (i) and equation (ii)

$$\frac{h}{72} = \frac{128}{h}$$

$h^2 = 72 \times 128$

$h^2 = 9216$

$$\boxed{h = 96m}$$

$\therefore$ The height of the building is 96m.

@apna_pdf

$$\frac{\sqrt{3}}{2}=\frac{120}{AC} \qquad \left\{\sin 60^0=\frac{\sqrt{3}}{2}\right\}$$

$$AC=\frac{120\times 2}{\sqrt{3}}$$

$$\boxed{AC=80\sqrt{3}\,cm}$$

(c) $8.4\left(\sqrt{3}+3\right)$ (d) $4.2\left(\sqrt{3}+1\right)$

SSC CGL 21/04/2022 (Shift-III)

BC = h

BD = BC + CD

= h + 8.4

In ΔABD,

$$\tan 30^0=\frac{h}{(h+8.4)}$$

$$\frac{1}{\sqrt{3}}=\frac{h}{8.4+h}$$

$$h=\frac{8.4}{\sqrt{3}-1}\times\frac{\sqrt{3}+1}{\sqrt{3}+1}=\frac{8.4(\sqrt{3}+1)}{2}$$

$$=4.2\left(\sqrt{3}+1\right)m$$

$$\frac{1}{2}=\frac{12.5}{AD}$$

AD = 25

$\therefore$ The length of the wire = 25m

$$\cos 60° = \frac{x}{20} = \frac{\text{Base}}{\text{Hypotenuse}}$$

OS = h

QO = (40 – h)

In ΔPOQ,

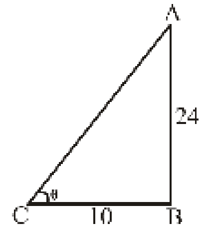
(a) 10 (b) 18

(c) 7.5 (d) 19.5

SSC CPO-SI 25/11/2020 (Shift-I)

Ans. (a) : Given

$\tan\theta = \frac{12}{5}$ .... (i)



In ΔABC

$\Rightarrow \ \tan\theta = \frac{AB}{CB}$

From equation ----- (i)

$CB = 24 \times \frac{5}{12} = 10c.m$

$CB = 24 \times \frac{5}{12} = 10cm$

Hence required distance (CB) = 10cm

68. A person was standing on a road near a mall. He was 1215 m away from the mall and able to see the top of the mall from the road in such a way that the top of a tree, which is in between him and the mall, was exactly in line of sight with the top of the mall. The tree height is 20 m and it is 60 m away from him. How tall (in m) is the mall?

(a) 405 (b) 250

(c) 300 (d) 375

SSC CPO-SI 25/11/2020 (Shift-I)

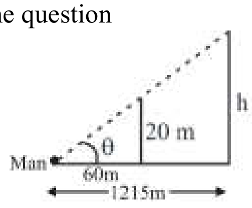
Ans. (a) : Given,

Height of the tree = 20m.

Distance of tree from the person = 60m.

Distance of the mall from the person = 1251 m.

According to the question



$\tan\theta = \frac{20}{60} = \frac{1}{3}$......(1)

$\tan\theta = \frac{h}{1215}$......(2)

From equations (1) and (2),

Hence, Height of the mall = 405 m

69. A ladder is resting against a wall, the angle between the foot of the ladder and the wall is 45^0 and the foot of the ladder is 6.6 m away from the wall. The length of the ladder (in m) is:

(a) $2.2\times\sqrt{2}$ (b) $3.6\times\sqrt{2}$

(c) $3.3\times\sqrt{2}$ (d) $6.6\times\sqrt{2}$

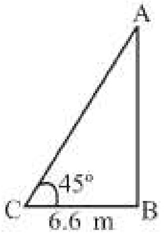
SSC CPO-SI 25/11/2020 (Shift-II)

Ans. (d) : Given,

BC = 6.6 m.

$\angle ACB = 45^0$

In ΔABC ,



$\cos45^0 = \frac{BC}{AC}$

$\Rightarrow \frac{1}{\sqrt{2}} = \frac{6.6}{AC}$

Hence, the length of the ladder $(AC) = 6.6\times\sqrt{2}$ m.

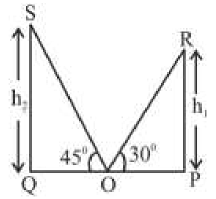
Length of tower B = QS = h_2

$\angle ROP = 30^0$, $\angle SOQ = 45^0$

and



OP = OQ

$\therefore$ In ΔRPO ,

$\tan30^0 = \frac{PR}{OP}$

$\frac{1}{\sqrt{3}} = \frac{h_1}{OP}$

$\therefore$ In ΔSQO ,

$\tan45^0 = \frac{SQ}{OQ}$

$\Rightarrow 1 = \frac{h_2}{OQ} \Rightarrow OQ = h_2$ ----- (ii)

From equations (i) and (ii)–

Geometry

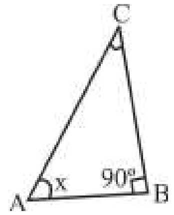
(I) Problems based on Lines and Angles

1. If in a right angle triangle the measure of one angle is 30º more than its smallest angle, then the measure of the smallest angle is ?

(a) 90º (b) 60º
(c) 30º (d) 75º

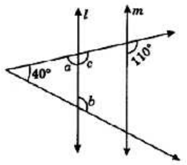
SSC CGL (Tier-I) 27/07/2023 (Shift-III)

Ans. (c) : Let the smallest angle be x.
According to question, $\angle C = x + 30^0$
In ΔABC



$\angle A + \angle B + \angle C = 180^0$
$x + 90^0 + x + 30^0 = 180^0$
$2x = 60^0 \Rightarrow x = 30^0$
Hence, the smallest angle is 30º.

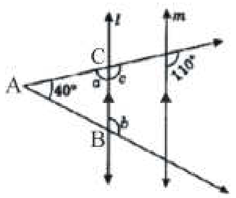
2. In the following figure if *l*||*m*. then find the measure of the angles marked by a and b



(a) a = 60º and b = 120º
(b) a = 55º and b = 125º
(c) a = 70º and b = 110º
(d) a = 90º and b = 90º

SSC CGL 08/12/2022 (Shift-IV)

Ans. (c) : According to the figure,



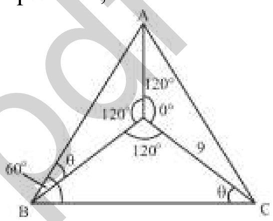
c = 110° (Corresponding Angle)
a = 180° – 110° (Linear pair Angle)
a = 70°
$\angle b$, is an outer angle of ΔABC
b = a + 40
= 70° + 40° = 110°
b = 110°

3. O is a point located in ΔABC such as OA = 12 cm, OC = 9 cm, ∠AOB = ∠BOC = ∠ COA and ∠ABC = 60º, what is the length of OB (in cm) ?

(a) $4\sqrt{6}$ (b) $4\sqrt{3}$
(c) $6\sqrt{3}$ (d) $6\sqrt{2}$

SSC CGL (Tier-II) 29/01/2022 (Shift-I)

Ans. (c) : From question,



$\angle AOB = \angle BOC = \angle COA = \frac{360}{3} = 120^0$
$\angle ABC = 60^0$
Sum of all three angles of an triangle $= 180^0$
In ΔAOB
$\angle OBA + \angle BAO + \angle AOB = 180^0$
$\theta + \angle BAO + 120° = 180^0$
$\angle BAO = 180° - 120° - \theta$
$= 60° - \theta$
Again in ΔBOC
$\angle OBC = \angle ABC - \angle OBA$
$\angle OBC = 60° - \theta$
$\angle OBC + \angle BOC + \angle OCB = 180^0$
$60° - \theta + 120° + \angle OCB = 180^0$
$\angle OCB = \theta$
By ΔAOB and ΔBOC
$\angle OAB = \angle OBC$
$\angle AOB = \angle BOC$
$\angle OBA = \angle OCB$
$\Delta AOB \sim \Delta BOC$ (AAA Similarity)
Now,
$\frac{OA}{OB} = \frac{OB}{OC}$
$\frac{12}{OB} = \frac{OB}{9}$
$OB^2 = 108$
$OB = 6\sqrt{3}$ cm

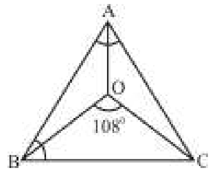
@apna_pdf

4. In ΔABC, O is an intersecting point of bisector of ∠A and ∠B. If ∠BOC = 108º, then what will be the measure of ∠BAO?

(a) 36^0 (b) 27^0
(c) 18^0 (d) 40^0

SSC CGL (Tier-II) 29/01/2022 (Shift-I)

Ans. (c):



$\angle BOC = 108^0$

In ΔABC Bisetor of ΔABC and ΔACB meets at point O, then

$\angle BOC = 90^0 + \frac{1}{2}\angle A$

$108^0 = 90^0 + \frac{1}{2}\angle A$

$\frac{1}{2}\angle A = 18^0$

$\angle A = 36^0$

given that,

$\angle BAO = \frac{\angle A}{2}$

$= \frac{36}{2}$

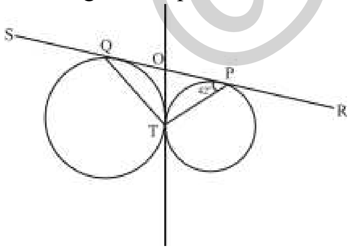
$\angle BAO = 18^0$

5. Two circles touch each other externally at point T. RS is a direct common tangent line which touches the circles at point P and Q. If ∠TPQ = 42º, what is the measure (in degree) of ∠PQT ?

(a) 60 (b) 45
(c) 48 (d) 42

SSC CGL 11/04/2022 (Shift-III)

Ans. (c) : According to the question,



OQ = OT

∠OQT = ∠OTQ .... (i)

OT and OP are the two tangent lines of a common circle drawn from the same outer point O.

OP = OT

∠OPT = ∠OTP

$\angle TPQ = 42^0$

$\angle TPQ = \angle OPT = \angle OTP = 42^0$

In ΔOPT

$\angle OPT + \angle OTP + \angle POT = 180^0$

$42° + 42° + \angle POT = 180^0$

$\angle POT = 96^0$

$\angle POT + \angle QOT = 180^0$

$96^0 + \angle QOT = 180^0$

$\angle QOT = 84^0$

In ΔQOT

$\angle OQT + \angle OTQ + \angle QOT = 180^0$

$\angle OQT + \angle OQT + 84° = 180^0$ (By equation (i))

$2\angle OQT = 96$

$\angle OQT = 48^0$

$\angle PQT = 48^0$

6. The angles of a triangle are (8x – 15)º, (6x – 11)º and (4x – 10)º. what is the value of x?

(a) 12º (b) 16º
(c) 15º (d) 18º

SSC CGL (Tier-I) 12/04/2022 (Shift-III)

Ans.(a) From question,

∵ Sum of all angles of a triangle = 180º

∴ 8x –15º + 6x – 11º + 4x – 10º = 180º

⇒ 18x – 36º = 180º

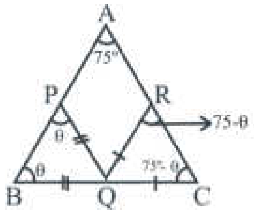
⇒ 18x = 216º ∴ x = 12º

7. In a ΔABC, Points P, Q and R are taken on AB, BC and CA, respectively, such that BQ = PQ and QC = QR. If ∠BAC = 75º, what is the measure of ∠PQR (in degrees)?

(a) 40 (b) 30
(c) 50 (d) 75

SSC CGL (Tier-I) 11/04/2022 (Shift-I)

Ans. (b)



∠ RQC = 180º – 75º + θ – 75º + θ

∠RQC = 2θ – 30º

∠PQB = 180º – 2θ

∠PQR + ∠PQB + ∠RQC = 180º

∠PQR = 180º – 180º + 2θ – 2θ + 30º

∠PQR = 30º

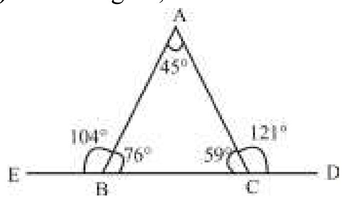
8. The exterior angle obtained on producing the base of a triangle both the ways are 121° and 104°. What is the measure of the largest angle of the triangle?

(a) 66° (b) 75°
(c) 76° (d) 74°

SSC CGL (Tier-II)-2019 – 18/11/2020

Ans. (c) : From figure,

2



@anna_pdf

$\because \angle ABE = 104°$ ($\because$ given)

$\therefore \angle ABC = 180° – 104° = 76°$

$\because \angle ACD = 121°$ ($\because$ given)

$\therefore \angle ACB = 180° – 121° = 59°$

$\angle A = 180° – (\angle B + \angle C)$

$= 180° – (76° + 59°)$

$= 180° – 135°$

$\angle A = 45°$

$\angle B = 76°$

$\angle C = 59°$

Hence, measure of the largest angle of the triangle $\angle B = 76°$

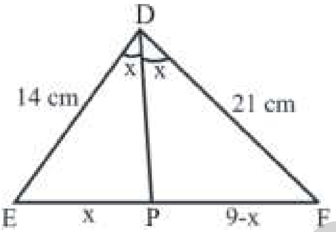
(II) Problems based on Congruency and Similarity of Triangles

9. In a triangle DEF, DP is a bisector of ∠D which meets EF at P. If DE= 14cm, DF = 21 cm and EF = 9 cm then find the value of EP.

(a) 3.6 cm (b) 6.3 cm
(c) 5.4 cm (d) 2.7 cm

SSC CHSL (Tier-I) 03/08/2023 (Shift-II)

Ans. (a) : Given that,



DE = 14cm, DF = 21cm

EF = 9cm EP = ?

Suppose EP = x cm ``````````

then, PF = 9 – x

$\because$ DP, is a bisector of ∠D

So, by Bisector Theorem

$$\frac{DE}{DF} = \frac{EP}{PF} \Rightarrow \frac{14}{21} = \frac{x}{9-x} \Rightarrow \frac{2}{3} = \frac{x}{9-x}$$

$5x = 18 \Rightarrow \boxed{x = 3.6 \text{ cm}}$

10. Which of the option given with sides makes a triangle?

(a) 8, 2, 6 (b) 8, 6, 9
(c) 100, 200, 300 (d) 10, 25, 11

SSC CHSL (Tier-I) 03/08/2023 (Shift-II)

Ans. (b) : $\because$ We know that –

"The sum of two sides is greater than the third side and the difference of two sides is less than the third side."

Taking the options.

(a) 2+6 = 8 > 8 Triangle is not possible.

(b) 8 + 6 = 14 > 9 8 – 6 = 2 < 9 Triangle is possible.

(c) 100 + 200 = 300 = 300 Triangle is not possible.

(d) 10 + 11 = 21 < 25 Triangle is not possible.

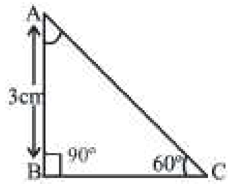
Hence option (b) is correct.

11. Let ABC is a triangle of whose angle B is Right angle. If ∠C = 60º and AB = 3 cm then find the length of BC and AC respectively.

(a) $9\text{cm}, 4\sqrt{3}\text{cm}$ (b) $\sqrt{3}\text{cm}, 4\sqrt{3}\text{cm}$
(c) $\sqrt{3}\text{cm}, 2\sqrt{3}\text{cm}$ (d) $3\text{cm}, 2\sqrt{3}\text{cm}$

SSC CHSL (Tier-I) 04/08/2023 (Shift-III)

Ans. (c) :



In Right Angle triangle Δ ABC,

$$\tan 60º = \frac{AB}{BC}$$

$$\Rightarrow \sqrt{3} = \frac{3}{BC} \Rightarrow \boxed{BC = \sqrt{3}\text{ cm}}$$

$$\& \sin 60º = \frac{AB}{AC}$$

$$\Rightarrow \frac{\sqrt{3}}{2} = \frac{3}{AC} \Rightarrow AC = \sqrt{3} \times 2 \Rightarrow \boxed{AC = 2\sqrt{3}\text{ cm}}$$

Hence BC and AC respectively $\sqrt{3}$ cm and 2 $\sqrt{3}$ cm.

12. All the three angles of a triangle are (x - 15)º, (x + 45)º and (x + 60)º. Then identify the type of the triangle.

(a) Isosceles Triangle
(b) Equilateral Triangle
(c) Right Angle Triangle
(d) Obtuse Angle Triangle

SSC CHSL (Tier-I) 17/08/2023 (Shift-II)

Ans. (c) : Sum of all three angles of a triangle is 180º.

$\therefore$ (x – 15)° + (x + 45)° + (x + 60)° = 180

$\Rightarrow$ 3x = 180° – 90°

$\Rightarrow$ x = 30°

So all three angle are respectively 15º, 75º and 90º

Hence the triangle will be Right angle triangle.

13. Three sides of a triangle are 9, 24 and S unit. Which of the following is correct?

(a) $15 < S < 33$ (b) $15 \leq S \leq 33$
(c) $15 \leq S < 33$ (d) $15 < S \leq 33$

SSC CHSL (Tier-I) 02/08/2023 (Shift-I)

Ans. (a) : Sides of the triangle are 9, 24 and S.

"Sum of two sides of a triangle is greater than the third side and the difference is less than the third side"

$24 - 9 < S < 24 + 9$

$\boxed{15 < S < 33}$

Therefore (a) is correct.

14. Two triangle XYZ and UVW are congruent triangles. If the area of ΔXYZ is 58 cm², what will be area of ΔUVW?

@apna_pdf

(a) 58 cm^2 (b) 29 cm^2
(c) 15 cm^2 (d) 116 cm^2

SSC CHSL (Tier-I) 08/08/2023 (Shift-II)

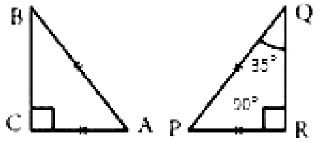
Ans. (a): ∵ Area of congruent triangles are equal,
Area of ΔUVW = area of ΔXYZ
Area of ΔUVW = 58 cm^2

15. Two sides of a triangle are 14 cm and 9 cm. Which of the following can be the third side of triangle?
(a) 17 cm (b) 5 cm
(c) 23 cm (d) 24 cm

SSC CHSL (Tier-I) 09/08/2023 (Shift-III)

Ans. (a) : ∵ Sum of two sides of a triangle is greater than the third side and the difference is less than the third side.
So, 14 + 9 = 23
14 - 9 = 5
Then
5 < third side < 23
Hence, third side can be 17.

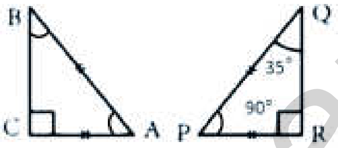
16. If ΔABC ≅ ΔPQR then find the value of ∠A ?



(a) 35° (b) 45°
(c) 55° (d) 90°

SSC CHSL (Tier-I) 11/08/2023 (Shift-I)

Ans. (c) :

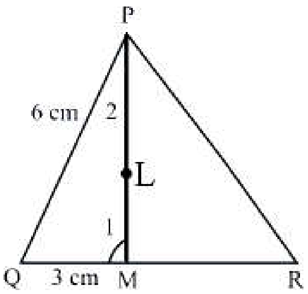


∵ Given that, ΔABC ≅ ΔPQR
$\angle B = \angle Q = 35^0$, $\angle C = \angle R = 90^0$ $\angle A = \angle P = 180 - (90^0 + 35^0) = \boxed{55^0}$

17. L is a center of an equilateral triangle. If PQ = 6 cm, what is the length of PL?
(a) $4\sqrt{3}$ cm (b) $2\sqrt{3}$ cm
(c) $3\sqrt{3}$ cm (d) $5\sqrt{3}$ cm

SSC CGL (Tier-I) 24/07/2023 (Shift-III)

Ans. (b) :
∵ Centroid divides the median in 2 : 1
So, PL : LM = 2 : 1



In ΔPMQ
$PM = \sqrt{6^2 - 3^2}$
$= \sqrt{27}$
$= 3\sqrt{3}$ cm
$PL = \frac{2}{3} \times PM = \frac{2}{3} \times 3\sqrt{3} = \boxed{2\sqrt{3}\text{ cm}}$

18. If ΔABC and ΔDEF are congruent, which of the following is Incorrect?
(a) Perimeter of both the triangles is equal.
(b) The ratio of AC and DF is 2 :1
(c) Ratio of Angles in both the triangle is equal.
(d) AB = DE and BC = EF.

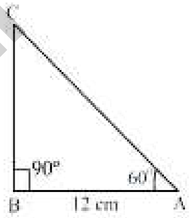
SSC CGL (Tier-I) 24/07/2023 (Shift-III)

Ans. (b) : ∵ In congruent triangles sides are equal so ratio of their sides can't be 2 : 1.

19. If ΔABC at right angled at B, AB =12 and $\angle CAB = 60^0$ then find the length of BC.
(a) $12\sqrt{12}$ cm (b) 12
(c) $24\sqrt{3}$ cm (d) $12\sqrt{3}$ cm

SSC CGL (Tier-I) 21/07/2023 (Shift-II)

Ans. (d) :



Formula : $\tan\theta = \frac{P}{B}$

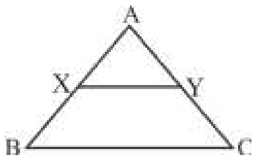
$\tan 60° = \frac{BC}{12}$

$\sqrt{3} = \frac{BC}{12} \Rightarrow \boxed{BC = 12\sqrt{3}\text{cm}}$

20. In ABC, the mid point of AB and AC are respectively X and Y. If BC + XY =18 units, what is the value of (BC – XY) ?
(a) 4 cm (b) 12 cm
(c) 6 cm (d) 8 cm

SSC CGL (Tier-I) 19/07/2023 (Shift-IV)

Ans. (c) :



∵ The mid points of AB and AC are X and Y
(By mid point theorem) XY || BC
and $XY = \frac{1}{2}BC \Rightarrow BC = 2XY$
Given that, BC + XY = 18

@apna_pdf

2XY + XY = 18 ⇒ XY = 6

BC = 2 XY = 2 × 6 = 12

BC - XY = 12 - 6 = $\boxed{6\text{ cm}}$

21. If M is the mid point of side BC of triangle ABC, and area of ABM is 19 cm^2. What is the area of ΔABC.

(a) 40 cm^2 (b) 42 cm^2

(c) 36 cm^2 (d) 38 cm^2

SSC Selection Posts XI-28/06/2023 (Shift-III)

Ans. (d) : ∵ M is the mid point of Δ ABC

According to the question,

Let the area of ΔABM and ΔABC are 1 and 2 units.

∵ Area of Δ ABM = 19 cm^2

1 unit = 19 cm^2

2 unit = 2 × 19 = 38 cm^2

So: Area of ΔABC = 38 cm^2

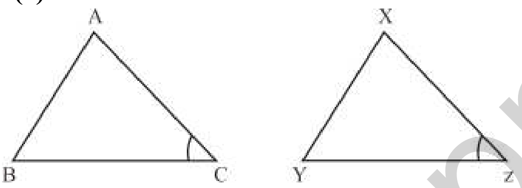
22. If m∠C=m∠Z and AC=XZ which of the following conditions is compulsory for the congruency of ABC and ΔXYZ?

(a) BC=YZ (b) AB=XY

(c) BC=AB (d) AB=AC

SSC CGL (Tier-I) 14/07/2023 (Shift-I)

Ans. (a) :



AC = XZ

m ∠C = m∠Z

For the congruency of ΔABC and XYZ

BC = YZ is compulsory. (By SAS Rule)

23. Select the true statement belongs to the properties of a triangle.

(a) Sum of two sides is always equal to third side

(b) Sum of two sides is always less than third side

(c) Sum of two sides can be equal to third side

(d) Sum of two sides is always greater than third side

SSC CGL (Tier-I) 27/07/2023 (Shift-III)

Ans. (d) : ∵ Sum of two sides is always greater than the third side.

So option (d) is correct.

24. ABC is an equilateral triangle. side BC is extended to point D. If A meets with D and BC = CD then measure of angle CAD is equal to ?

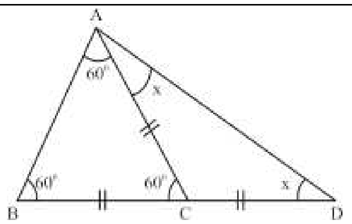
(a) 30º (b) 15º

(c) 18º (d) 45º

SSC CHSL (Tier-I) 09/08/2023 (Shift-III)

Ans. (a) : Given that,

ABC is an equilateral triangle.



and BC = CD

∵ BC = CA = CD

Let ∠CAD = x = ∠ADC

$60^0 = x + x$ (rule of exterior angle)

$2x = 60^0 \Rightarrow x = 30^0$

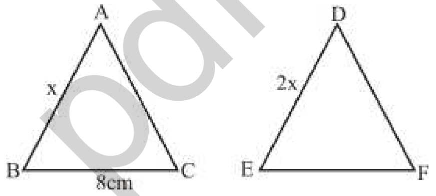
25. If ΔABC~ΔDEF are such that 2AB = DE and BC = 8cm then the length EF is ?

(a) 18 cm (b) 16 cm

(c) 20 cm (d) 22 cm

SSC CGL 07/12/2022 (Shift-II)

Ans. (b) :



Where,

ΔABC ~ ΔDEF,

AB : DE = 1 : 2

$\frac{AB}{DE} = \frac{BC}{EF} \Rightarrow \frac{1}{2} = \frac{8}{EF}$

$\boxed{EF = 16cm}$

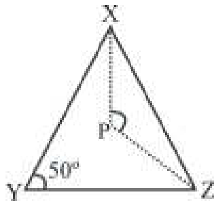
26. In triangle XYZ, P is the In-center of XYZ. If ∠XYZ = 50 then find the value of ∠XPZ.

(a) 140º (b) 100º

(c) 115º (d) 130º

SSC CGL 07/12/2022 (Shift-II)

Ans. (c) : By figure,



Rule:– (If θ is ∠XYZ then ∠XPZ = $90 + \frac{\theta}{2}$

Then,

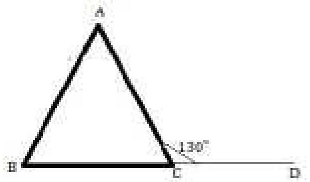
$\angle XPZ = 90° + \frac{50°}{2}$

= 90º + 25º

= 115º

27. If ΔABC is drawn as shown in which AB = AC and ∠ACD = 130º. which of the following will be equal to ∠BAC ?

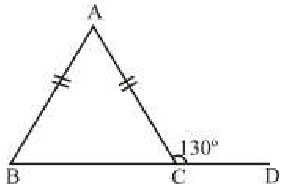
@apna_pdf



(a) 60° (b) 70°
(c) 80° (d) 50°

SSC CGL 07/12/2022 (Shift-IV)

Ans. (c) : The given triangle,



$\angle ABC = \angle ACB$

$\angle ACD + \angle ACB = 180^o$

$130^o + \angle ACB = 180^o$

$\angle ACB = 180 - 130 = 50^o$

$\angle ABC + \angle ACB + \angle BAC = 180^o$

$50^o + 50^o + \angle BAC = 180^o$

$\angle BAC = 180^o - 100^o = 80^o$

28. In any PQR AB is drawn parallel to QR which cuts the sides at point A and B, where the length of PQ = 6 cm length of QR = 8 cm and length of QA = 3cm. what is the length of AB?

(a) 4.2 cm (b) 4.0 cm
(c) 2.4 cm (d) 5.0 cm

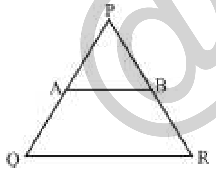
SSC CGL 08/12/2022 (Shift-IV)

Ans. (b) : Given that - PQ = 6 cm

QR = 8 cm

and QA = 3 cm

PA = 6 – 3 = 3 cm



According to question

$\Delta PAB \sim \Delta PQR$

$$\frac{PA}{PQ} = \frac{AB}{QR}$$

$$\frac{3}{6} = \frac{AB}{8}$$

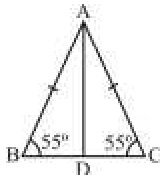
$\therefore$ AB = 4 cm

29. ABC is an Isosceles triangle AB = AC. $\angle ABC = 55^o$ and AD is median of base BC. Find the mesure of $\angle BAD$.

(a) 90° (b) 35°
(c) 50° (d) 55°

SSC MTS 01/09/2023 (Shift I[st])

Ans. (b) : In Isosceles ΔABC, AB = AC



$\angle ABC = \angle ACB = 55°$

$\angle BAC = 180° - 110° = 70°$

AD is a bisector of $\angle A$

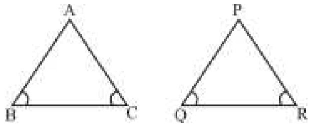
$$\angle BAD = \frac{70}{2} = 35°$$

30. What is ASA Congruency Rule of triangle, where A and S represents angle and side of triangle respectively ?

(a) Two triangles are said to be congruent if all the sides of both the triangles are equal.
(b) Two triangles are said congruent if two angles and the included angle of one triangle are equal to 2 sides and the included angle of the other triangle
(c) Two triangle are said to be congruent if 2 sides and an interior angle of one triangle are equal to 2 sides and an interior angle of the other triangle.
(d) Two triangles are said to be congruent if any pair of 2 angles and any 1 pair of sides of both the triangles are equal

SSC CGL 12/12/2022 (Shift-III)

Ans. (b) : (ASA) congruency Rule :-



Two Δ are called congruent when two angles and the inner side of one triangle are equal to two angles and the inner side of the other triangle.

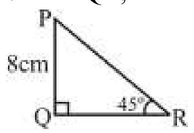
So option (b) is correct answer.

31. In ΔPQR , $\angle Q = 90^o$, PQ = 8 cm and $\angle PRQ = 45^o$ find the length of QR.

(a) 3 cm (b) 5 cm
(c) 8 cm (d) 6 cm

SSC CGL 13/12/2022 (Shift-I)

Ans. (c) : In ΔPQR,



By the figure,

$\angle PQR + \angle PRQ + QPR = 180^o$

$90^o + 45^o + \angle QPR = 180^o$

$\angle QPR = 180^o - (90^o + 45^o)$

$= 180^o - 135^o = 45^o$

$\because$ $\angle QPR = \angle PRQ = 45^o$

$\therefore$ QR = PQ = 8cm

@apna_pdf

QR = 8cm

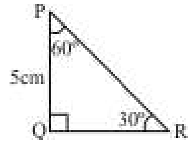
32. In ΔPQR, right angle is at Q, the length of PQ is 5 cm and ∠PRQ = 30º, find the length of QR.

(a) $\frac{1}{\sqrt{3}}$ cm (b) $\frac{5}{\sqrt{3}}$ cm

(c) $5\sqrt{3}$ cm (d) $3\sqrt{3}$ cm

SSC CGL 13/12/2022 (Shift-IV)

Ans. (c) :



Given that - PQ = 5 cm

∠PRQ = 30º

$\tan 30^\circ = \frac{PQ}{QR}$

$\Rightarrow \frac{1}{\sqrt{3}} = \frac{5}{QR}$

$\therefore \boxed{QR = 5\sqrt{3}\text{ cm}}$

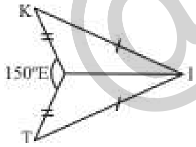
Ans. (c) :



ΔKEI and ΔTEI in

given that KI = IT

KE = TE

EI = EI (common)

(a) 70º (b) 80º

(c) 90º (d) 60º

SSC CGL 13/12/2022 (Shift-IV)

Ans. (a) : Given that -

In ΔABC, ∠B + ∠C = 110º

∵ Sum of all three angles of a triangle is 180º

∴ ∠A = 180º – (∠B + ∠C)

= 180º – 110º

∠A = 70º

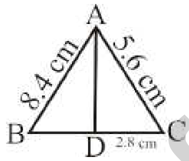
(a) 2.8 cm (b) 5.6 cm

(c) 4.2 cm (d) 7 cm

SSC CGL 05/12/2022 (Shift-I)

Ans. (d) :



$\frac{AB}{BD} = \frac{AC}{DC}$ (By Bisector theorem)

(a) 66º (b) 76º

(c) 80º (d) 32º

SSC CGL 01/12/2022 (Shift-IV)

$$\frac{80}{\Delta DEF} = \frac{16}{25}$$

$$\Delta DEF = \frac{80 \times 25}{16}$$

Area of ΔDEF = 125 cm^2

(a) 5 cm (b) 7 cm

SSC CGL 06/12/2022 (Shift-IV)

Ans. (b) : According to the question,

"When two triangles are similar then the ratio of their corresponding sides is equal to the ratio of their perimeters."

$$\Rightarrow \frac{AB}{DE} = \frac{BC}{EF} = \frac{AC}{DF} = \frac{\text{Perimeter of} \Delta ABC}{\text{Perimeter of} \Delta DEF}$$

$$\Rightarrow \frac{9.1}{6.5} = \frac{\text{Perimeter of} \Delta ABC}{25}$$

(a) 26 (b) 24
(c) 25 (d) 27

SSC CGL (Tier-I) 18/04/2022 (Shift-III)

We know that,

$\frac{\text{Area of } \Delta PQR}{\text{Area of } \Delta MNT} = \frac{(\text{Side of } \Delta PQR)^2}{(\text{Side of } \Delta MNT)^2}$

$\frac{196}{169} = \left(\frac{28}{\text{Side of } \Delta MNT}\right)^2$

$\sqrt{\frac{196}{169}} = \frac{28}{\text{Side of } \Delta MNT}$

Since CN $\perp$ BD & $\angle NCB = \angle NCD$,

In ΔNBC and ΔNDC,

In ΔABC,

∠A = 66º---------[Given]

$\because$ Point I is the incentre of ΔABC

Then,

$$\angle BIC = 90^\circ + \frac{\angle A}{2}$$

Hence, ∠BIC = 123º

130. In Δ PQR, ∠PQR = 135°, PQ = $8\sqrt{2}$ cm and PR = 17 cm. What is the length (in cm) of QR?

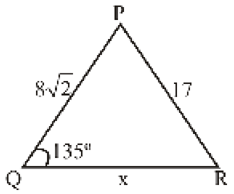
(a) 10 (b) 7
(c) 9 (d) 8

SSC CHSL 19/08/2021 (Shift-II)

Ans. (b) : In ΔPQR,

Let QR = x cm

From formula,



$$\cos Q = \frac{QP^2 + QR^2 - PR^2}{2QP \times QR}$$

$$\cos 135^\circ = \frac{(8\sqrt{2})^2 + (x)^2 - (17)^2}{2 \times 8\sqrt{2} \times x}$$

$$-\frac{1}{\sqrt{2}} = \frac{128 + x^2 - 289}{16\sqrt{2}x}$$

$$-1 = \frac{x^2 - 161}{16x}$$

$x^2 + 16x - 161 = 0$

$x^2 + 23x - 7x - 161 = 0$

x (x + 23) –7 (x + 23) = 0

(x + 23) (x – 7) = 0

x = –23, 7

Hence QR = x = 7cm

In ΔRST if RQ, SP and TN are the medians and intersects to each others at point O.

In ΔCMB,

$\therefore AC = \sqrt{(CD)^2 + (AD)^2}$

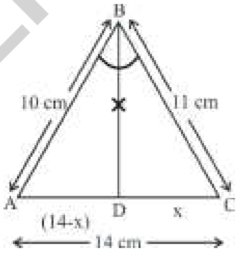
(a) 7 cm (b) $\frac{22}{3}$ cm

(c) cm (d) $\frac{20}{3}$ cm

SSC CGL (Tier-II) 12-09-2019

Ans. (d) :



By Angle bisector theorem,

$\frac{AB}{AD} = \frac{BC}{CD}$ $\left(\begin{array}{l}\because CD = x \\ \therefore AD = (14\text{-}x)\end{array}\right)$

$$\frac{10}{(14-x)} = \frac{11}{x} \Rightarrow 10x = 11 \times 14 - 11x$$

$21x = 11 \times 14$

$x = \frac{11 \times 14}{21} = \frac{22}{3}$

$\therefore AD = (14 - x) = 14 - \frac{22}{3} = \frac{20}{3}$ cm.

(c) 94^0 (d) 102^0

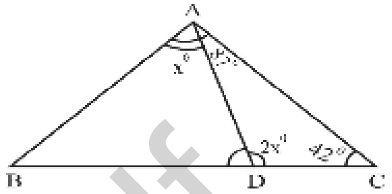
SSC CHSL (Tier-I) 04/07/2019 (Shift-I)

Ans. (b) : In ΔABC,

Let $\angle BAD = x^0$

then $\angle ADC = 2 \times \angle BAD$

$\angle ADC = 2x^0$



then $\angle DAC = \angle BAC - \angle BAD$

$\angle DAC = 87^0 - x^0$

$\angle ADB = 180^0 - \angle ADC$ [linear pair]

$\angle ADB = 180^0 - 2x^0$

$\angle ADB = \angle DAC + \angle ACD$ [exterior angle]

$180^0 - 2x^0 = 87^0 - x^0 + 42^0$

$180^0 - 129^0 = x^0$

$x^0 = 51^0$

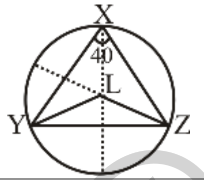
(a) 70° (b) 40°
(c) 50° (d) 60°

SSC CHSL –19/03/2020 (Shift-II)

Ans. (c) : $\because \angle YXZ = 40^o$

$\therefore \angle YLZ = 2 \times 40 = 80^o$



[Since, angle subtended by chord on the centre is double the angle subtended by same chord on the circumference of the circle]

$\therefore \angle LYZ = \angle YZL$
[YL and ZL are the radii of circle]

$\therefore \angle YLZ + \angle LYZ + \angle YZL = 180^o$

$80^o + \angle YZL + \angle YZL = 180^o \quad (\because \angle LYZ = \angle YZL)$

SSC CHSL –19/03/2020 (Shift-I)

$x+y+z=15$

$\because y+z=8$

$\therefore x=15-8=7$

(c) $5 < x < 11$ (d) $5 < x$

SSC CHSL –17/03/2020 (Shift-I)

Ans. (c) : Since, for the construction of a triangle, sum of its two sides is always greater than the third side and difference of its two sides is always smaller than the third side.

Hence, $a + b > c$ or $a - b < c$

Hence, option (c) satisfy the above rule.

$\angle ABC + \angle BCA + \angle BAC = 180°$

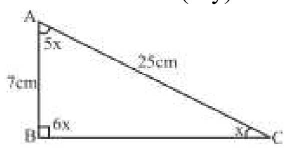
Sum of all angles of triangle is 180º.

$\angle ACB = x$ (say)



$\therefore \quad 6x + 5x + x = 180º$

$\angle ACB = x = 15º$

$\angle CAB = 5x = 5 \times 15 = 75º$

Hence triangle is a right angled triangle.

(a) 28° (b) 32°

(c) 30° (d) 45°

Sum of opposite angle of cyclic quadrilateral is 180º.

$\Rightarrow \angle ADC + \angle ABC = 180^O$

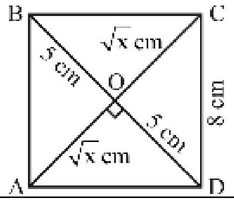
(VI) Problems based on Rhombus

323. ABCD is a Rhombus which each side is 8 cm. If BD = 10 cm and $AC = 2\sqrt{x}$ cm. what is the value of $\sqrt{x+10}$?

(a) 5 (b) 7
(c) $2\sqrt{3}$ (d) $3\sqrt{2}$

SSC MTS 11/09/2023 (Shift IIst)

Ans. (b) : BD = 10 cm, AC = $2\sqrt{x}$ cm



In ΔAOD

$AD^2 = OA^2 + OD^2$

$8^2 = \left(\sqrt{x}\right)^2 + 5^2$

$64 = x + 25$

$x = 39$

So : $\sqrt{x+10} = \sqrt{39+10}$

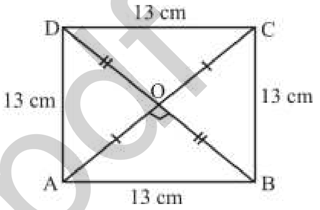
$= \sqrt{49} = 7$ cm

324. Length of each side of a rhombus is 13 cm and one of the diagonal is 24 cm. What is the area (in cm²) of the rhombus ?

(a) 120 (b) 300
(c) 60 (d) 240

SSC CGL–(Tier-I) 13/08/2021 (Shift I)

Ans. (a) : ∵ Diagonals of rhombus bisect each other at 90^0.



OA = 12 cm

In ΔAOB, (By Pythagoras Theorem)

$AB^2 = OA^2 + OB^2$

$169 = 144 + OB^2$

$25 = OB^2$

OB = 5

∴ BD = 5 × 2 = 10cm

Area of rhombus $= \frac{1}{2}\times$ product of diagonals

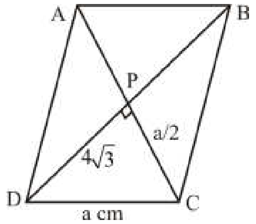
$= \frac{1}{2}\times 24\times 10 = 120\ cm^2$

325. One diagonal of a rhombus is $8\sqrt{3}$ cm. If the other diagonal is equal to its side, then the area (in cm²) of the rhombus is:

(a) $12\sqrt{3}$ (b) $16\sqrt{3}$
(c) $24\sqrt{3}$ (d) $32\sqrt{3}$

SSC CHSL 12/04/2021 (Shift-I)

Ans : (d)



Let the Length of side of rhombus = a cm

According to the question,

In ΔDPC,

$a^2 - \frac{a^2}{4} = 16\times 3$

@apna_pdf

$\frac{3a^2}{4} = 48$

$a^2 = 16 \times 4 = 64$

a = 8 cm

As per question: – Length of side of rhombus = Length of other diagonal of given rhombus = 8cm.

Area of Rhombus = $\frac{1}{2} \times d_1 \times d_2$

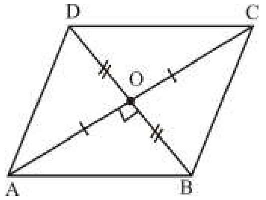
$= \frac{1}{2} \times 8\sqrt{3} \times 8 = 32\sqrt{3}\ \text{cm}^2$

326. The perimeter of a rhombus is 148 cm, and one of its diagonals is 24 cm. The area (in cm²) of the rhombus is:

(a) 700 (b) 840
(c) 770 (d) 875

SSC CHSL 13/04/2021 (Shift-I)

Ans. (b) :



Diagonals of rhombus bisect each other at 90°

Side = $\frac{148}{4} = 37$ cm

If BD = 24 cm

OB = $\frac{24}{2} = 12$ cm

in ΔAOB,

OA = $\sqrt{37^2 - 12^2} = 35$ cm

∴ AC = 70 cm

Area of rhombus = $\frac{1}{2} \times$ product of diagonals

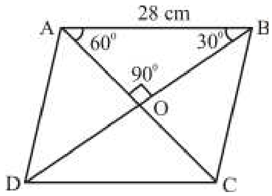
$= \frac{1}{2} \times 24 \times 70 = 840\ \text{cm}^2$

327. A rhombus of side 28 cm has one angle of 60°. What is the length of the larger diagonal?

(a) 28 cm (b) $28\sqrt{2}$ cm
(c) $28\sqrt{3}$ cm (d) $28(1+\sqrt{3})$ cm

SSC CHSL 04/08/2021 (Shift-II)

Ans. (c) :



In right angle triangle ΔAOB the side in front of 30° = Hypotenuse/2

∴ AO = 14 cm.

The side in front of 60° $= 14\sqrt{3}$

Hence the length of diagonal = BD = $2 \times 14\sqrt{3}$

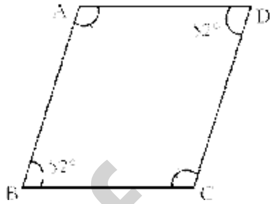
$= 28\sqrt{3}$ cm

328. ABCD is a rhombus, in which ∠ABC = 52° then find the value of ∠ACD.

(a) 26° (b) 64°
(c) 54° (d) 48°

SSC CGL (Tier-II)-2019 – 18/11/2020 (Shift-I)

Ans. (b) : According to question,
ABCD is a rhombus



∵ Opposite angles of a rhombus are equal

∴ ∠ABC = ∠ADC and ∠BAD = ∠BCD

Diagonal bisects angles of a rhombus

∴ ∠ABC + ∠ADC + ∠BAD + ∠BCD = 360°

52° + 52° + ∠BAD + ∠BCD = 360°

2∠BCD = 360° – 104°

∠BCD = 128°

∴ $\angle ACD = \frac{\angle BCD}{2} = 64°$

SSC CPO-SI 23/11/2020 (Shift-I)

Diagonal $(d_1) = 10$ cm

Area of rhombus = area of ΔABC + area of ΔADC

($\because$ area of ΔABC = area of ΔADC)

(ΔABC ~ ΔADC)

Area of rhombus = 2 × area of ΔABC

From Heron's formula,

area of $\Delta ABC = \sqrt{s(s-a)(s-b)(s-c)}$

$s = \frac{a+b+c}{2} = \frac{13+13+10}{2} = 18$

$\boxed{s = 18}$

Area of rhombus = 2 × 60 = 120 cm^2

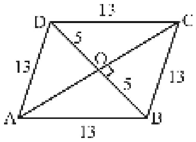
(a) 120 (b) 192
(c) 96 (d) 50

SSC CHSL (Tier-I) 04/07/2019 (Shift-III)

Ans. (a):



$\because$ Diagonals bisect each other at right angle of a rhombus.

OB = OD = 5 cm

OA = OC

$\angle BOC = 90^0$

In ΔOBC ,

$OC^2 = BC^2 - OB^2$

$OC^2 = 13^2 - 5^2$

OC = 12 cm

$\therefore$ AC = AO + OC = 12 + 12 (AO = OC)

AC = 24 cm

Area of rhombus $= \frac{d_1 d_2}{2} = \frac{10 \times 24}{2} = 120\ cm^2$

333. ABCD is a rhombus whose each side is 8 cm. If BD = 10 cm, $AC = 2\sqrt{x}$ cm then what is the value of $\sqrt{x+10}$?

(a) 5 (b) 7

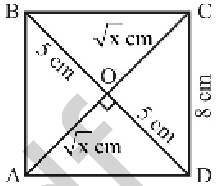
SSC CHSL (Tier-I) 11/07/2019 (Shift-II)

Ans. (b) : BD = 10 cm, $AC = 2\sqrt{x}$ cm



In ΔAOD,

$AD^2 = OA^2 + OD^2$

$8^2 = \left(\sqrt{x}\right)^2 + 5^2$

64 = x + 25

x = 39

Hence, $\sqrt{x+10} = \sqrt{39+10}$

$= \sqrt{49}$

(c) 360 cm^2 (d) 480 cm^2

SSC MTS 08/08/2019 (Shift-III)

$OB = \sqrt{(26)^2 - (24)^2}$

$OB = \sqrt{676 - 576}$

$OB = \sqrt{100}$

OB = 10 cm

$\because$ BD = 2×OB

BD = 2×10

BD = 20 cm

$\because$ Area of rhombus $= \frac{1}{2} \times d_1 \times d_2$

$\Rightarrow AC = 15$ cm.

382. In ΔABC, ∠C = 90°, AC = 5 cm and BC = 12 cm. The bisector of ∠A meets BC at D. What is the length of AD?

(a) $\frac{2}{3}\sqrt{13}$ cm (b) $2\sqrt{13}$ cm
(c) $\frac{4}{3}\sqrt{13}$ cm (d) $\frac{5\sqrt{13}}{3}$ cm

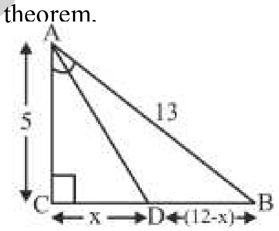
SSC CGL (Tier-I)-2019 – 05/03/2020 (Shift-I)

Ans. (d) :

In ΔACB,

$AB = \sqrt{5^2 + 12^2} = 13\text{cm}$

By internal angle bisector theorem.



$\frac{AC}{CD} = \frac{AB}{BD}$

$\frac{5}{x} = \frac{13}{12 - x}$

$60 - 5x = 13x$

$x = \frac{60}{18} = \frac{10}{3}$ cm

In ΔACD,

$AD^2 = 5^2 + \left(\frac{10}{3}\right)^2 = 25 + \frac{100}{9} = \frac{325}{9}$

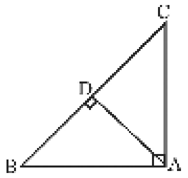
$AD = \frac{5\sqrt{13}}{3}$ cm

383. In a ΔABC, ∠BAC = 90⁰, *AD* is drawn perpendicular from *A* on *BC*. Which among the following is the mean proportional between *BD* and *BC*?

(a) AD (b) AB
(c) CD (d) AC

SSC MTS 05/10/2021 (Shift-I)

Ans. (b) :



In ΔBCA ~ ΔBAD

$\frac{BC}{AB} = \frac{AB}{BD}$

$AB^2 = BC \times BD$

Hence the mean proportional between BA and BC will be AB.

384. In a right angled triangle ABC, if ∠ABC = 90°, AB=6cm, BC=8cm, and BD is perpendicular to AC, then AD : DC is:

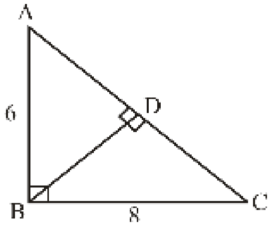
(a) 9 : 16 (b) 7 : 16
(c) 9 : 14 (d) 8 : 15

SSC CHSL 19/04/2021 (Shift-III)

Ans. (a) : In ΔABC, from Pythagoras theorem,

$AC^2 = (6)^2 + (8)^2 = 36 + 64 = 100$

$AC = \sqrt{100} = 10cm$



Now, From $AD = \frac{AB^2}{AC}$

$AD = \frac{(6)^2}{10} = \frac{36}{10} = 3.6cm$

Then DC = AC – AD = 10 – 3.6 = 6.4 cm.

Hence, AD : DC = 3.6 : 6.4

AD : DC = 9 : 16

385. In ΔABC, ∠C = 90⁰ and CD is perpendicular to AB at D. If AD/BD = $\sqrt{k}$ then AC/BC = ?

(a) $\frac{1}{\sqrt{k}}$ (b) $\sqrt{k}$
(c) k (d) $\sqrt[4]{k}$

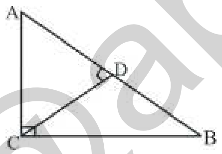
$\frac{AC}{BC} = \sqrt[4]{k}$



386. In a triangle ABC, AB = $6\sqrt{3}$ cm, AC = 12 cm and BC = 6 cm. Then measure of ∠B is equal to:

(a) 45° (b) 60°

SSC CGL (Tier-II)-2019 – 18/11/2020 (Shift-I)

Ans. (d) : ΔABC

By Pythagoras theorem,

$AB^2 + BC^2 = AC^2$

∵ ABC is a right angled triangle in which ∠B = 90°

387. In the given figure, if AB = 8 cm, AC = 10 cm, ∠ABD = 90⁰ and AD = 17 cm, then the measure of CD is:

(c) 9 cm (d) 11 cm

SSC CGL (Tier-I)-2019 – 06/03/2020 (Shift-II)

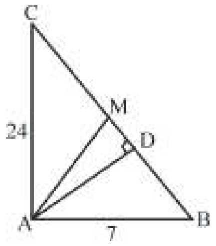
(c) 32 : 43 (d) 24 : 25

SSC CGL (Tier-I)-2019 – 04/03/2020 (Shift-I)

Ans. (b) :



$BC^2 = 7^2 + 24^2 = 25^2$

BC = 25 cm

Area of ΔABC $= \frac{1}{2} \times 7 \times 24$

$\frac{1}{2} \times BC \times AD = \frac{1}{2} \times 7 \times 24$

$AD = \frac{7 \times 24}{25}$ cm

∵ M is the mid point of BC

$AM = \frac{BC}{2} = \frac{25}{2}$ [From theorem]

$\therefore AD : AM = \frac{7 \times 24}{25} : \frac{25}{2}$

= 336 : 625

(a) 5 (b) 6 (c) 17 (d) 9

SSC CPO SI 9/11/2022 (Shift I[st])

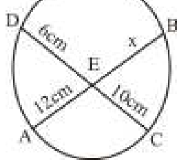
Ans. (a) : Given that CD = 16 cm

DE = 6 cm

AE = 12 cm

BE = x

CE = 16 – 6 = 10 cm



By theorem, AE × BE = CE × DE

12 × x = 10 × 6

(a) 12 (b) $3\sqrt{13}$ (c) 9 (d) $9\sqrt{13}$

SSC CPO SI 11/11/2022 (Shift IIIrd)

OA = OC (Radius of circle)

or $OA^2 = OC^2$

$6^2 + x^2 = 9^2 + (15-x)^2$

(c) 9.75 cm (d) 7.5 cm

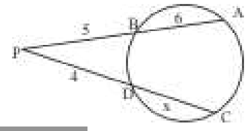
Ans. (c) : Given, AB = 6 cm, PB = 5 cm, PD = 4 cm,
Let CD = x cm



$\therefore$ PA × PB = PC × PD

(6 + 5) × 5 = (4 + x) × 4

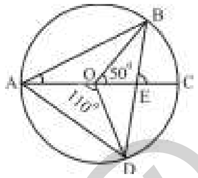
(a) 80^0 (b) 55^0
(c) 70^0 (d) 90^0

SSC CGL (TIER-I)-2018 – 10.06.2019 (Shift-I)

Ans. (a) :



$\because$ Angle subtended by a chord on the centre is double the angle subtended by the same chord at circumference of the circle.

$\angle BAC = \frac{\angle BOC}{2} = 25^0$

$\angle ABD = \frac{\angle AOD}{2} = 55^0$

(a) 20.4 (b) 18.4
(c) 19.2 (d) 18.6

SSC CGL (TIER-I)-2018 – 07.06.2019 (Shift-II)

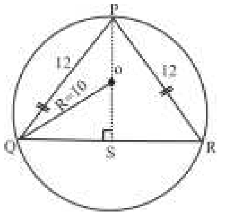
$10 = \frac{QR \times 12 \times 12}{4 \times \frac{1}{2} \times QR \times PS}$

PS = 7.2 cm



In ΔPSQ,

$\because$ Angle subtended the center O of circle is half of the angle made on its circumference.

$\therefore \angle PSQ = \frac{\angle POQ}{2}$

$= \frac{54^o}{2}$

In ΔONQ
$OQ^2 = ON^2 + NQ^2$

$\Rightarrow 576 - 338 = 34x$
$\Rightarrow 34x = 238$
$\Rightarrow x = 7$
On putting the value of x in eq^n (i)
$r^2 = (7)^2 + (24)^2$
$r^2 = 49 + 576$
$r = \sqrt{625}$
r = 25cm

$25 = OP^2 + 9$
OP = 4 cm
In Δ OQC,
$\therefore$ $QC^2 = OC^2 - OQ^2$

$= 16$
QC = 4

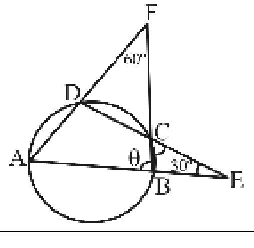
(a) 75^0 (b) 70^0
(c) 80^0 (d) 65^0

SSC CPO-SI – 12/12/2019 (Shift-I)

Ans. (a)

Let, $\angle ABC = \theta$

$\angle BCE = xº$



@apna_pdf

∴ From exterior angle theorem

$\theta = x + 30^\circ$ …….(1)

∴ $\angle FCD = x$ (Vertically Opposite angle)

∴ $\angle FDC = x + 30^\circ$

Exterior angle of cyclic quadrilateral

∴ In ΔFDC,

$x + x + 30^\circ + 60^\circ = 180^\circ$

$2x = 90$

$x = 45^\circ$

From equation (1)

$\theta = 45^0 + 30^0$

$= 75^0$

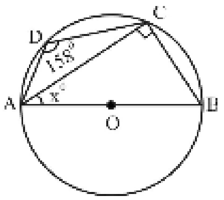
(a) 50^0 (b) 38^0

(c) 40^0 (d) 68^0

SSC CHSL –02/07/2019 (Shift-II)

Ans. (d)



Given,

ABCD is a cyclic quadrilateral and AB is the diameter of circle.

$\angle ADC = 158^0$

$\angle ADC + \angle ABC = 180^0$ (Theorem)

$158^0 + \angle ABC = 180^0$

$\angle ABC = 180^0 - 158^0$

$\angle ABC = 22^0$

We know that, angle made in semi circle is 90º

$\angle ACB = 90^0$

In Right angled triangle ΔABC

$\angle BAC + \angle ACB + \angle ABC = 180^0$

$\angle BAC + 90^0 + 22^0 = 180^0$

$\angle BAC = 180^0 - 112^0$

$\angle BAC = 68^0$

∵ [Sum of opposite angle of a cyclic quadrilateral 180°]

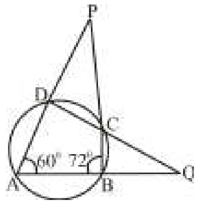
(a) 40^0 (b) 36^0
(c) 24^0 (d) 30^0

SSC CGL (Tier-I)-2019 – 05/03/2020 (Shift-II)

Ans. (b)



In ΔPAB,

@apna_pdf

$\angle DPC = 180° - (60° + 72°) = 48°$

$\because$ Sum of opposite angles of a cyclic quadrilateral is 180º

$\angle ADC = 180° - 72° = 108°$

In ΔDAQ,

$\angle BQC = 180° - (60° + 108°) = 12°$

$\therefore \angle DPC - \angle BQC = 48° - 12° = 36°$

509. Two chords AB and CD of a circle with centre O intersect each other at P. If ∠APC = 95° and ∠AOD = 110°, then ∠BOC is:

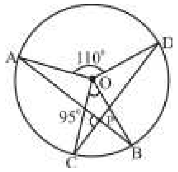
(c) 65^0 (d) 55^0

SSC CGL (Tier-I)-2019 – 05/03/2020 (Shift-I)

Ans. (b)



$\angle CPB = 180° - 95° = 85°$ (linear pair)

$\because \angle CPB = \dfrac{\angle AOD + \angle BOC}{2}$ (by using theorem)

$85° = \dfrac{110^0 + \angle BOC}{2}$

$\angle BOC = 170º - 110° = 60°$

510. Sides AB and DC of a cyclic quadrilateral AB and CD are produced to meet at E, and sides AD and BC are produced to meet at F. If ∠ADC = 75°, and ∠BEC = 52°, then the difference between ∠BAD and ∠AFB is:

In ΔADE ,

$\angle BAD = 180° - (75° + 52°) = 53°$

$\because$ Sum of opposite angles of a cyclic quadrilateral is 180º

$\therefore \angle ABC = 180° - 75° = 105°$

In ΔAFB,

$\angle AFB = 180° - (53° + 105°) = 22°$

Difference $= 53° - 22° = 31°$

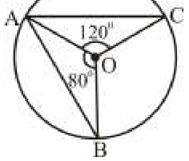
(c) 80^0 (d) 75^0

SSC CGL (Tier-I)-2019 – 06/03/2020 (Shift-III)

Ans. (c)



$\angle BOC = 360° - (120° + 80°) = 160°$

(a) 50° (b) 90°

(c) 80° (d) 100°

SSC CGL (Tier-I)-2019 – 07/03/2020 (Shift-I)

Ans. (c) $\because$ Sum of opposite angle of a cyclic quadrilateral = 180°

$\therefore \angle A + \angle C = 180°$

$\angle C = 180° - 100° = 80°$

513. In a circle, AB is a the diameter and CD is a chord. AB and CD produced to meet at a point P, outside the circle. If PD = 15.3 cm, CD = 11.9 cm and AP = 30.6 cm, then the radius of the circle is:

(a) 7.5 cm (b) 8.5 cm

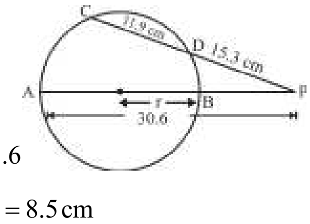
(c) 9 cm (d) 8 cm

SSC CGL (Tier-I)-2019 – 09/03/2020 (Shift-III)

Ans. (b) :

$\because PD \times PC = PB \times PA$ (by theorem)

$15.3 \times 27.2 = PB \times 30.6$



$PB = \dfrac{15.3 \times 27.2}{30.6}$

$= 13.6$ cm

$\therefore AB = 30.6 - 13.6$

$\therefore$ radius $(r) = \dfrac{17}{2} = 8.5\,cm$

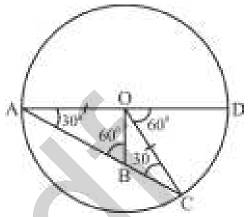
(a) 4 cm (b) $3\sqrt{5}$ cm

(c) $5\sqrt{3}$ cm (d) 5 cm

SSC CHSL 01/07/2019 (Shift-III)

Ans. (d) :



$\angle AOC + \angle DOC = 180^0$ (Linear pair)

$\angle AOC + 60^0 = 180^0$

$\angle AOC = 120^0$

In triangle AOC,

$\therefore$ $\angle ACO = \angle OAC$ (corresponding angles of equal corresponding sides)

$\angle OAC + \angle ACO + \angle AOC = 180^0$

$2\angle ACO + 120^0 = 180^0$

$\angle ACO = \frac{60^0}{2}$

$\angle ACO = 30^0$

(a) 12cm (b) 48 cm

$\angle AOB = 2\ \angle ADB = 2 \times 78^0 = 156^0$

$\angle AOB + \angle APB = 180^0$ (By theorem)

$\angle APB = 180^0 - 156^0 = 24^0$

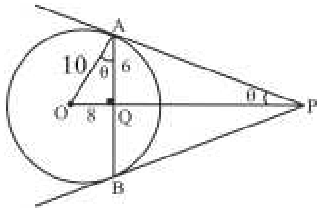
(a) 7.5 (b) 4
(c) 3.75 (d) 15

SSC CGL–(Tier-I) 18/08/2021 (Shift I)

Ans. (a) :



In ΔOQA,

$AQ = \sqrt{10^2 - 8^2} = 6cm$

$\because\ \angle APQ = \angle OAQ$ (By theorem)

$\therefore \Delta OAQ \sim \Delta APQ$

$\frac{QO}{AQ} = \frac{AO}{AP}$

$\frac{8}{6} = \frac{10}{AP}$

$\boxed{AP = 7.5\ cm}$

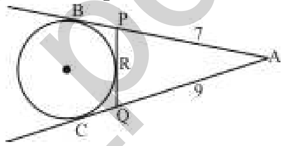
(a) 7 (b) 5
(c) 8 (d) 6

SSC CGL–(Tier-I) 16/08/2021 (Shift II)

Ans. (d) : From question,



$\because$ The tangents drawn from same external point are equal in lengths.

$\therefore$ AB = AC, BP = PR and CQ = QR

So, AC = 11 cm [$\because$ AB = 11 is given]

$\because$BP = AB – AP = 11–7 = 4cm

CQ = AC – AQ = 11–9 = 2cm

$\therefore$ PR = 4cm [$\because$ BP = PR]

and QR = 2cm [$\because$ CQ = QR]

$\therefore$ PQ = PR + QR

= 4 + 2

= 6 cm.

Hence, option (d) is correct answer.

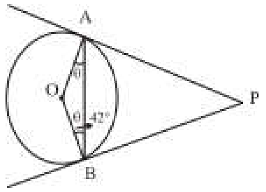
(a) 78º (b) 84º
(c) 76º (d) 86º

SSC CHSL 06/08/2021 (Shift-I)

Ans. (b) :



∵ ∠OBA = ∠OAB = θ = 42°

$36 + 36 = 5x$

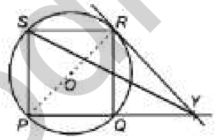
(c) $6\sqrt{10}$ (d) $3\sqrt{5}$

SSC CGL (Tier-II) 20-02-2018

Ans. (a) :



$Side = \frac{diagonal}{\sqrt{2}} = 4\sqrt{2}$

Line joining the centre and tangent point is perpendicular to tangent.

$\therefore \angle PRY = 90^0$

$\angle SRP = \angle QRP = 45^0$

$\angle QRY = \angle PRY - \angle PRQ = 45°$

Hence ΔRQY is isosceles triangle

Ans. (b) : Each exterior angle of a regular pentagon $= \frac{360^o}{n} = \frac{360^o}{5} = 72^0$

Each interior angle $= 180^0 - 72^0 = 108^0$

@apna_pdf

$\therefore \ \angle ABC = 108^0$

$\angle BAJ = 72^0$

$\angle EGD = 180^0 - (72^0 + 72^0) = 36^0$

Hence,

$$\frac{\angle ABC + 2\angle EGD + 3\angle BAJ}{6}$$

$$= \frac{108^o + 72^o + 216^o}{6}$$

$$= \frac{396^o}{6} = 66^0$$

700. Each side of a equilateral triangle is 18 cm, what is the ratio on in radius and circum radius of the triangle?

(a) 3 : 4 (b) 2 : 1
(c) 3 : 2 (d) 1 : 2

SSC CHSL (Tier-I) 14/08/2023 (Shift-IV)

Ans. (d) : We know that the ratio of in radius and circum radius of an equilateral Δ is 1 : 2

$$\therefore \ \frac{\text{In radius}}{\text{Circumradius}} = \frac{\frac{a}{2\sqrt{3}}}{\frac{a}{\sqrt{3}}} = 1:2$$

Where, a = side of the equilateral Δ

701. ΔPQR is an equilateral triangle inscribed in a circle. S is any point on the arc QR. Find the measure of ∠PSQ.

(a) 60º (b) 30º
(c) 90º (d) 45º

SSC CGL (Tier-I) 18/07/2023 (Shift-III)

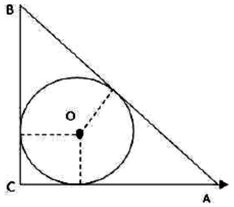
Ans. (a) : ∵ Δ PQR is an equilateral Δ

So, $\angle P = \angle Q = \angle R = 60^0$

∠PSQ = ∠PRQ (Angles subtended by an arc in the same segment of a circle are equal)

$\angle PSQ = 60^0$

702. A circle of radius 4 cm is drawn incribed in a right angle triangle ABC, right angled at C. If AC = 12 cm then find the value of BC

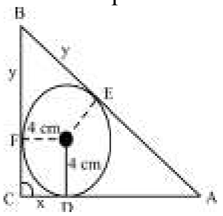


(a) 8 cm (b) 12 cm
(c) 20 cm (d) 16 cm

SSC CGL (Tier-I) 25/07/2023 (Shift-IV)

Ans. (d) : AC = 12 cm

Let, CD = x = CF (The tangents drawn to the circle from an external point are equal to each other)



AD = 12 - x = AE

Let – BF = BE = y

Radius r = x = 4 cm

Right Angled ΔACB

$AB^2 = AC^2 + BC^2$

$[(y + (12\text{-}x)]^2 = 12^2 + (x+y)^2$

$[(y + (12\text{-}4)]^2 = 12^2 + (4 + y)^2$

$y^2 + 64 + 16y = 144 + 16 + y^2 + 8y$

$8y = 144 + 16 - 64$

$8y = 160 + 64$

$y = \frac{96}{8} = 12 \text{ cm}$

CB = x + y = 4 + 12 = 16 cm

703. If the ratio of an exterior angle and an interior angle of a regular polygon is 1 : 5, then find the number of sides in the polygon.

(a) 24 (b) 22 (c) 30 (d) 12

SSC MTS 04/05/2023 (Shift Ist)

Ans. (d) : We know that,

Exterior Angle $= \frac{360}{n}$ (Where n is the number of sides in a polygon)

Interior Angle $= \frac{(n-2)180}{n}$

According to the question,

$$\frac{360}{n} \times \frac{n}{(n-2)180} = \frac{1}{5}$$

(n – 2) = 10

∴ n = 12

704. ABC is an equilateral triangle with side 12 cm and AD is the median. Find the length of GD if G is the centroid of ΔABC.

(a) $3\sqrt{3}$ cm (b) $6\sqrt{3}$ cm
(c) $4\sqrt{3}$ cm (d) $2\sqrt{3}$ cm

SSC CGL (Tier-II)-2019 – 18/11/2020

Ans. (d): In ΔADB,

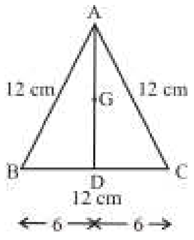
$AB^2 = AD^2 + BD^2$

$12^2 = AD^2 + 6^2$

$AD^2 = 144 - 36$

$AD = \sqrt{108}$

$AD = 6\sqrt{3}$ cm



Hence, $GD = \frac{1}{3} \times AD$

$= \frac{1}{3} \times 6\sqrt{3}$

$GD = 2\sqrt{3}$ cm

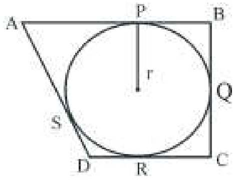
705. A circle is inscribed in a quadrilateral ABCD touching AB, BC, CD and AD at the points P, Q, R and S, respectively, and $\angle B = 90^0$. If AD = 24 cm, AB = 27 cm and DR = 6 cm, then what is the circumference of the circle?

(a) 18 π (b) 12 π
(c) 20 π (d) 15 π

SSC CGL (Tier-II) 12-09-2019

Ans. (a) :



∵ Tangents drawn from exterior point of a circle are equal.

AP = AS, BP = BQ, CQ = CR, DR = DS

∴ DR = DS = 6 cm

AS = 24 – 6 = 18 cm

∴ AS = AP = 18 cm

BP = 27 – 18 = 9 cm

∴ BQ = 9 cm

∴ r = 9 cm

Circumference of circle = 2πr = 18 π cm

706. A circle is inscribed in a equilateral triangle of side 24 cm. What is the area (in cm^2) of a square inscribed in the circle?

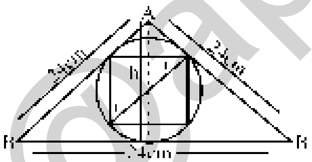
(a) 96 (b) 72
(c) 48 (d) 54

SSC CPO-SI – 12/12/2019 (Shift-I)

Ans. (a) ΔABC is equilateral triangle.

$$\text{Inradius} = \frac{\text{Side}}{2\sqrt{3}} = \frac{24}{2\sqrt{3}}$$

$$= \frac{12}{\sqrt{3}} \text{cm}$$



$$\therefore \text{ Diameter } = 2 \times \frac{12}{\sqrt{3}}$$

∵ Diagonal of square = diameter of inradius

$$\text{diagonal of square } = \frac{24}{\sqrt{3}}$$

$$\therefore \text{ area of square } = \frac{(\text{diagonal})^2}{2} = \frac{\left(\frac{24}{\sqrt{3}}\right)^2}{2}$$

$$= \frac{24 \times 24}{\sqrt{3} \times \sqrt{3}} \times \frac{1}{2}$$

area of square = 96 cm^2

707. The sides of ΔABC are 10cm, 10.5 cm and 14.5 cm. What is the radius of its circumcircle?

(a) 7.5cm (b) 5cm
(c) 7.25cm (d) 5.25cm

SSC CPO-SI – 11/12/2019 (Shift-II)

Ans. (c)

a : b : c = 10 : 10.5 : 14.5
= 2:2.1:2.9

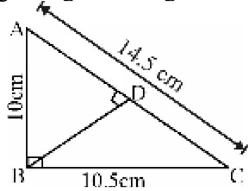
∵ $c^2 = a^2 + b^2$

$(2.9)^2 = (2)^2 + (2.1)^2$

8.41 = 4 + 4.41

8.41 = 8.41

⇒ ΔABC is a right angled triangle.



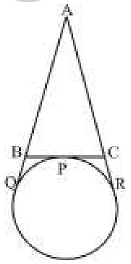
Length of radius of circumcircle (BD) = $\frac{AC}{2} = \frac{14.5}{2} =$ 7.25cm

708. A circle touches the side BC of a ΔABC at P and also touches AB and AC produced at Q and R, respectively. If the perimeter of ΔABC = 26.4cm, then the length of AQ is:

(a) 17.6cm (b) 13.2cm
(c) 8.8cm (d) 15.4cm

SSC CPO-SI – 09/12/2019 (Shift-II)

Ans. (b)



Perimeter of ΔABC = 26.4cm

AB + BC + CA = 26.4

AB + BP + PC + CA = 26.4

AB + BQ + CR + CA = 26.4 (BQ = BP, CR = CP)

Tangent lines drawn from exterior of a circle are equal.

AQ + AR = 26.4

2AQ = 26.4 (AQ = AR)

AQ = 13.2 cm

709. Two equilateral triangles are formed on the hypotenuse of an isosceles right angled triangle and on one of its perpendicular sides. Their areas are H and A respectively. $\frac{A}{H}$ is equal to:

(a) $\frac{1}{4}$ (b) $\frac{1}{2}$ (c) $\frac{1}{\sqrt{2}}$ (d) $\frac{1}{\sqrt[2]{2}}$

SSC CHSL (Tier-I) 10/07/2019 (Shift-II)

Ans. (b):

$\therefore$ hypotenuse $= \sqrt{x^2 + x^2} = \sqrt{2}.x$

Area of equilateral triangle made on hypotenuse (H)

$= \frac{\sqrt{3}}{4} \times \left(\sqrt{2}.x\right)^2$

Area of equilateral triangle made on altitude side

(A) $= \frac{\sqrt{3}}{4} \times (x)^2$

$\therefore \quad \frac{A}{H} = \frac{\frac{\sqrt{3}}{4} \times (x)^2}{\frac{\sqrt{3}}{4}\left(\sqrt{2}.x\right)^2}$

$\therefore \quad \frac{A}{H} = \frac{1}{2}$

(a) 175 (b) 180
(c) 150 (d) 165

SSC CHSL (Tier-I) 08/07/2019 (Shift-II)

Ans. (d) : Number of sides of polygon = 11

Number of triangles drawn from vertices of polygon $= {}^{11}C_3$

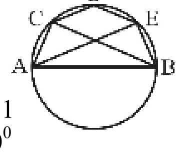
(c) 180^0 (d) 270^0

SSC CHSL (Tier-I) 04/07/2019 (Shift-I)

Ans. (d) : Construction : Draw BC and AE



$\because$ BEDC is a cyclic quadrilateral

$\therefore \quad \angle DCB + \angle DEB = 180^0$

By adding ∠ ACB on both side,

$\angle ACB + \angle DCB + \angle DEB = 1$

$\angle ACD + \angle DEB = 180^0 + 90^0$

Angle made in semicircle is right angle.

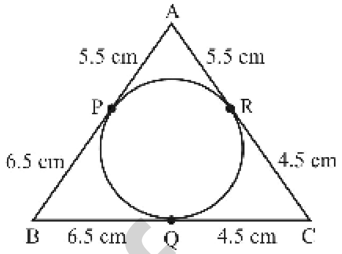
$\angle ACD + \angle DEB = 270^0$

713. A circle is inscribed in a triangle. It touches sides AB, BC and AC at points P, Q and R respectively. If BP = 6.5 cm, CQ = 4.5 cm and AR = 5.5 cm then perimeter of ΔABC is :

(a) 66 (b) 33
(c) 22 (d) 16.5

SSC CHSL (Tier-I) 04/07/2019 (Shift-II)

Ans. (b) $\because$ Tangent drawn from external point of a circle is equal.



$\therefore$ BP = BQ, CQ = CR and AP = AR

In ΔABC,

AB = AP + PB
= 5.5 + 6.5 = 12 cm

BC = BQ + QC
= 6.5 + 4.5
= 11 cm

AC = AR + RC = 5.5 + 4.5
= 10 cm

Perimeter of ΔABC = (AB + BC + CA)
= 12 + 11 + 10 = 33 cm

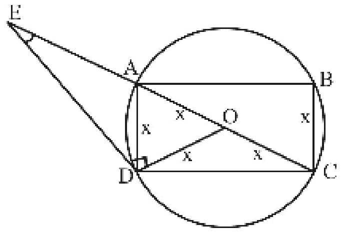
(a) 45^0 (b) 40^0 (c) 60^0 (d) 30^0

SSC CHSL (Tier-I) 03/07/2019 (Shift-II)

Ans. (d) :



Let, BC = x

then AC = 2x (diameter)

In ΔAOD,

AO = AD = OD = x

$\therefore$ ΔAOD is equilateral triangle

$\therefore \quad \angle AOD = 60^0$

Radius of a circle is perpendicular to its tangent.

$\therefore \quad \angle ODE = 90^0$

$\therefore$ In ΔODE,

$\angle DEO = 180^0 - (90^0 + 60^0)$
$= 30^0$

1. Find the coordinates of the points where the graph 57x – 19y = 399 cuts the coordinate axes.
(a) x-axis at (–7,0) and y-axis at (0,21)
(b) x-axis at (7,0) and y- axis at (0, –21)
(c) x-axis at (7,0) and y-axis at (0,21)
(d) x-axis at (–7,0) and y-axis at (0, –21)

SSC CGL Mains (Tier-II) 07/03/2022

Ans. (b) : Given,
$57x - 19y = 399$
$\frac{57x}{399} - \frac{19y}{399} = 1$
$\frac{x}{7} + \frac{y}{-21} = 1$
On comparing from intersect form $\frac{x}{a} + \frac{y}{b} = 1$
The line cuts x-axis at 7 and y-axis at –21.
Hence the co-ordinate of x-axis
Co-ordinate of y-axis = (0, –21)

2. Choose the correct answer from the alternatives given: If 2x + 3y = 12 and 3x – 2y = 5 then :
(a) x = 3, y = 2
(b) x = 2, y = 3
(c) x = –2, y = 3
(d) x = 3, y = –2

SSC CGL (Tier-II) 08/08/2022 (Shift-I)

Ans. (a) : Given,
2x + 3y = 12 and 3x – 2y = 5
from option (a) on putting x = 3, y = 2

2x + 3y = 12 and	3x – 2y = 5
2 × 3 + 3 × 2 = 12	3 × 3 – 2 × 2 = 5
6 + 6 = 12	9 – 4 = 5
$\boxed{12 = 12}$	$\boxed{5 = 5}$
L.H.S. = R.H.S.	L.H.S. = R.H.S.

Hence, option (a) will be the required answer.

3. Find the radius of the circle $x^2 + y^2$ –4x – 6xy – 12 = 0
(a) 3 (b) 4 (c) 2 (d) 5

$x^2 + y^2 - 4x + 6y - 12 = 0$ ...(i)
The standard equation of circle
$x^2 + y^2 + 2gx + 2fy + c = 0$ ...(ii)
On comparing equation (i) form equation (ii)
g = (–2)
f = 3
c = –12
Hence, Radius of circle $= \sqrt{g^2 + f^2 - c}$
$= \sqrt{(-2)^2 + 3^2 - (-12)}$
$= \sqrt{4+9+12} = \sqrt{25} = 5$

4. The graph of the equations 5x –2y + 1 = 0 and 4y –3x + 5 = 0, intersect at the point p(α, β). What is the value of (2α – 3β) ?
(a) 4
(b) –4
(c) 6
(d) –3

SSC CPO SI 11/11/2022 (Shift IIIrd)

–3x + 4y = –5 .... (ii)
Equation (i) × 2 + (ii)
10x – 4y = –2
–3x + 4y = –5
7x = –7
x = –1
from equation (i)
–2y = –1+ 5
y = – 2
∴ α = –1, β = – 2
(2α–3β) = –2 + 6 = 4

5. The graph of the equations $4x + \frac{1}{3}y = \frac{8}{3}$ and $\frac{1}{2}x + \frac{3}{4}y + \frac{5}{2} = 0$ intersect at a point P. The point P also lies on the graph of the equation.
(a) x + 2y – 5 = 0

(c) 3x – y – 7 = 0
(d) x – 3y – 12 = 0

SSC CGL (Tier-II) 29/01/2022 (Shift-I)

$\frac{1}{2}x + \frac{3}{4}y + \frac{5}{2} = 0$
$\frac{1}{2}x + \frac{3}{4}y = -\frac{5}{2}$.........(ii)
Equation (i)× 3 and –Equation (ii) × 24
12 x + y – (12x + 18y) = 8 + 60
– 17y = 68
y = –4
On putting the value of y in equation (i)
$4x + \left(-\frac{4}{3}\right) = \frac{8}{3}$
12x – 4 = 8
12x = 12
x = 1
On putting the value of (x,y) in option (c),

@apna_pdf

$3x - y - 7 = 0$
$3 \times 1 + 4 - 7 = 0$
$7 - 7 = 0$

$3x + y - 5 = 0$ .... (i)

$5x - 10 = 0$
$x = 2$
Putting x = 2 in equation (1)
$3 \times 2 + y - 5 = 0$

$\therefore\ \alpha + \beta + \gamma + \delta = 0 + 6 + \frac{5}{2} + 0$
$= \frac{17}{2}$

14. What is the equation of a circle with centre of origin and radius of 6 cm?
(a) $x^2 + y^2 - x - y = 36$ (b) $x^2 + y^2 - 36 = 0$
(c) $x^2 + y^2 - y = 36$ (d) $x^2 + y^2 - x = 36$

SSC CHSL –17/03/2020 (Shift-III)

Ans. (b) : Centre of origin of circle = (0,0)
Radius of the circle = 6 cm.
$\therefore$ Required equation of circle– $x^2 + y^2 = r^2$
So, $(x - 0)^2 + (y - 0)^2 = 6^2$
$x^2 + y^2 = 36$
$x^2 + y^2 - 36 = 0$

15. The equation of a straight line on a point (3, –5) and slope 2 is:
(a) $3x - 5y - 2 = 0$ (b) $5x - 2y + 3 = 0$
(c) $2x - y - 11 = 0$ (d) $3x - 2y - 5 = 0$

SSC CHSL –19/10/2020 (Shift-III)

Ans. (c) : ∵ The equation of the line passing through the point (x, y) and the slope m.
$(y - y_1) = m(x - x_1)$
Point = (3, –5), slope (m) = 2 (given)
$(y + 5) = 2 \times (x - 3)$
$y + 5 = 2x - 6$
$2x - y = 11$
$2x - y - 11 = 0$

16. Find the equation of a circle whose diameter has end points (4, 3) and (–2, 1).
(a) $x^2 + y^2 - 2x + 4y = 5$
(b) $x^2 + y^2 - 2x - 4y = 5$
(c) $x^2 + y^2 - 2x - 4y = 3$
(d) $x^2 + y^2 - 6x + 2y = 3$

SSC CHSL –15/10/2020 (Shift-II)

Ans. (b) : If the ends of the diameter are (x_1, y_1) and (x_2, y_2)
equation of the circle is $(x - x_1)(x - x_2) + (y - y_1)(y - y_2) = 0$
∵ Ends of the diameter of the circle are (4, 3) and (–2, 1) respectively, then the equation of circle is.
$(x-4)(x+2) + (y-3)(y-1) = 0$
$x^2 - 4x + 2x - 8 + y^2 - y - 3y + 3 = 0$
$x^2 + y^2 - 2x - 4y - 5 = 0$
$x^2 + y^2 - 2x - 4y = 5$

17. The equation of circle with centre (1,–2) and radius 4 cm is:
(a) $x^2 + y^2 - 2x + 4y = 16$
(b) $x^2 + y^2 + 2x - 4y = 11$
(c) $x^2 + y^2 - 2x + 4y = 11$
(d) $x^2 + y^2 + 2x - 4y = 16$

SSC CHSL –17/03/2020 (Shift-II)

Ans. (c) : Centre of the circle = (1, –2)
Radius (a) = 4 cm.
$\therefore$ equation of the circle $\Rightarrow (x - h)^2 + (y - k)^2 = r^2$
$(x - 1)^2 + (y + 2)^2 = 16$
$x^2 - 2x + 1 + y^2 + 4y + 4 = 16$
$x^2 + y^2 - 2x + 4y + 5 = 16$
$x^2 + y^2 - 2x + 4y = 11$

(I) Problems based on Triangle

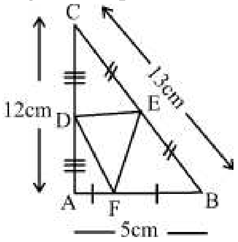
1. The three sides of a triangle are 5cm, 12cm and 13cm. What will be the area of the triangle formed by joining the midpoint of the three sides?

(a) $13\frac{1}{2}\text{cm}^2$ (b) 15 cm^2

(c) $7\frac{1}{2}\text{cm}^2$ (d) $19\frac{1}{2}\text{cm}^2$

SSC MTS 14/09/2023 (Shift-II)

Ans. (c) : According to the question,



Area of Δ ABC

$= \frac{1}{2} \times \text{Base} \times \text{Height}$

$= \frac{1}{2} \times 5 \times 12$

$= 30\text{ cm}^2$

$\therefore$ Area of triangle formed by joining the midpoint $= \frac{1}{4} \times$ Area of Δ ABC

$= \frac{1}{4} \times 30$

$= 7\frac{1}{2}\text{cm}^2$

2. The areas of two similar triangles TUV and PQR are 18 cm^2 and 32 cm^2 respectively. TU = 6cm, then length of PQ.

(a) 2cm (b) 8cm

(c) 4cm (d) 64cm

SSC CHSL (Tier-I) 14/08/2023 (Shift-IV)

Ans. (b) : From similar triangles TUV and PQR,

$$\frac{\text{Area of }\Delta\text{TUV}}{\text{Area of }\Delta\text{PQR}} = \frac{(\text{TU})^2}{(\text{PQ})^2}$$

$$\Rightarrow \frac{18}{32} = \frac{(6)^2}{(\text{PQ})^2} \Rightarrow \text{PQ} = \sqrt{\frac{6 \times 6 \times 32}{18}}$$

$\Rightarrow$ PQ = 8 cm

3. ΔABC ~ ΔPQR, AB = 12 cm, PQ = 18 cm and perimeter of ΔABC is 45cm. Find the perimeter of ΔPQR

(a) 30 cm (b) 70 cm

(c) 67.5 cm (d) 60 cm

SSC CHSL (Tier-I) 04/08/2023 (Shift-III)

Ans. (c) : $\because$ ΔABC and ΔPQR are similar triangle

$$\therefore \frac{\text{Perimeter of }\Delta\text{ABC}}{\text{Perimeter of }\Delta\text{PQR}} = \frac{\text{AB}}{\text{PQ}}$$

$$\frac{45}{\text{Perimeter of }\Delta\text{ PQR}} = \frac{12}{18}$$

Perimeter ΔPQR = 67.5 cm.

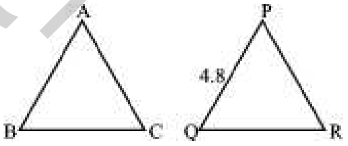
4. ΔABC, is similar to ΔPQR. If the ratio of perimeter of ΔABC and ΔPQR is 24: 16 and PQ = 4.8 cm, then what is the length of AB (in cm)?

(a) 4.6 (b) 7.2

(c) 8.6 (d) 2.8

SSC CHSL (Tier-I) 08/08/2023 (Shift-II)

Ans. (b) :



In ΔABC and ΔPQR

$$\frac{\text{Perimeter }\Delta\text{ABC}}{\text{Perimeter }\Delta\text{PQR}} = \frac{\text{Length of side AB}}{\text{Length of side PQ}}$$

$$\frac{24}{16} = \frac{\text{AB}}{4.8}$$

$$\text{AB} = \frac{24 \times 4.8}{16}$$

AB = 7.2cm

5. For congruent triangles, ΔABC and ΔDEF which of the following statements is correct?

(a) Perimeter of ΔABC < Perimeter of ΔDEF

(b) Perimeter of ΔABC = Perimeter of ΔDEF

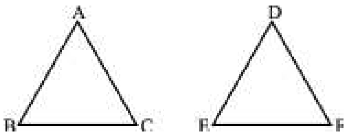
(d) Perimeter of ΔABC > Perimeter of ΔDEF

SSC CGL (Tier-I) 26/07/2023 (Shift-II)

Ans. (b):



ΔABC $\cong$ ΔDEF

Perimeter of ΔABC = Perimeter of ΔDEF

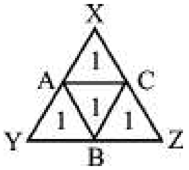
6. Suppose A,B and C be the midpoints of sides XY, YZ and ZX of ΔXYZ respectively. If the area of ΔXYZ is 8464 cm^2, then find the area of ΔABC (in cm^2).

(a) 1812 (b) 3112
(c) 1516 (d) 2116

SSC Selection Posts XI-27/06/2023 (Shift-III)

Ans. (d) : Given, Area of ΔXYZ = 8464 cm^2
According, to the question



It is clear from the above diagram that the midpoint A, B and C divide ΔXYZ into your equal triangles.

$\therefore \ \frac{1}{4} \times$ Area of ΔXYZ = Area of ΔABC

Area of ΔABC = $\frac{1}{4} \times 8464 \text{ cm}^2 = 2116 \text{ cm}^2$

7. The area of a trapezium is 180 cm^2 and its two parallel sides are 28 cm and 12cm. The distance between these two parallel sides of BC is.

(a) 12cm (b) 15cm
(c) 18cm (d) 9cm

SSC MTS 04/09/2023 (Shift-III)

Ans. (d) : Area of trapezium

$$= \frac{\text{Sum of parallel sides} \times \text{Height}}{2}$$

$$180 = \frac{(28+12) \times \text{Height}}{2}$$

$$\text{Height} = \frac{360}{40} = 9 \text{ cm}$$

8. Find the area of the triangle whose base is 7cm and corresponding height is 82 cm.

(a) 574 cm^2 (b) 287 cm^2
(c) 191 cm^2 (d) 143 cm^2

SSC MTS 08/09/2023 (Shift-III)

Ans. (b) : Base = 7 cm, Height = 82 cm

Area of triangle $= \frac{1}{2} \times \text{Base} \times \text{Height}$

Area of triangle $= \frac{1}{2} \times 7 \times 82 = 7 \times 41$

$= 287 \text{ cm}^2$

9. The ratio of sides of two similar triangles is 5 : 7. What will be the ratio of the areas of these triangles?

(a) 25 : 49 (b) 35 : 49
(c) 15 : 49 (d) 36 : 49

SSC CGL (Tier-I) 21/07/2023 (Shift-II)

Ans. (a) : Ratio of sides of two similar triangles is = $\frac{a_1}{a_2} = \frac{5}{7}$

∵ Triangles are similar

∴ Ratio of area of triangle $(A_1 : A_2) = (a_1)^2 : (a_2)^2$

$= (5)^2 : (7)^2$

$= 25 : 49$

10. The lengths of three sides of a triangle are 30 cm, 42 cm and x cm. Which of the following is true?

(a) 12<x<72 (b) 12≤x<72
(c) 12≤x≤72 (d) 12>x>72

SSC CGL (Tier-I) 17/07/2023 (Shift-II)

Ans. (a) : The difference between the two sides of a triangle is less than the length of the third side and the sum is greater than the length of the third side.

$(42 - 30) < x < (42 + 30)$

$\boxed{12 < x < 72}$

11. ΔXYZ and ΔPQR are similar. XY : PQ = 6 : 1 Area of ΔPQR is 6 cm^2. What is the area of ΔXYZ?

(a) 6 cm^2 (b) 261 cm^2
(c) 216 cm^2 (d) 36 cm^2

SSC CHSL Tier- II 26/06/2023

Ans.(c) : ∵ The ratio of the area of similar triangles is equal to the ratio of the square of the corresponding sides.

$$\frac{\text{Area of } \Delta XYZ}{\text{Area of } \Delta PQR} = \frac{XY^2}{PQ^2}$$

$$\frac{\text{Area of } \Delta XYZ}{6} = \frac{36}{1}$$

$\Rightarrow \boxed{\text{Area of } \Delta XYZ = 216 \text{ cm}^2}$

12. If the side of an equilateral triangle is 8 cm. Find the area of the triangle (correct to two decimal places).

(a) 27.71 cm^2 (b) 27.17 cm^2
(c) 27.2 cm^2 (d) 27.72 cm^2

SSC CGL 07/12/2022 (Shift-IV)

Ans. (a): Side of equilateral triangle = 8 cm

Area of an equilateral triangle $= \frac{\sqrt{3}}{4} \times \text{side}^2$

Area of equilateral triangle $= \frac{\sqrt{3}}{4} \times 8 \times 8$

$= 16 \times \sqrt{3}$

$= 16 \times 1.732$

$= 27.71 \text{ cm}^2$

13. If the ratio of corresponding sides of two similar triangle is $\sqrt{5} : \sqrt{7}$, then what is ratio of the area of the two triangles ?

(a) $\sqrt[3]{5} : \sqrt{7}$ (b) 5 : 7
(c) $\sqrt{5} : \sqrt{7}$ (d) 25 : 49

SSC CGL 09/12/2022 (Shift-IV)

@apna_pdf

Ans. (b) : Ratio of corresponding sides of two similar triangles $\sqrt{5}:\sqrt{7}$

$\therefore$ Ratio of area of two similar triangles = $\left(\sqrt{5}\right)^2 : \left(\sqrt{7}\right)^2$

5 : 7

14. The area of a triangle is 96 cm² and the ratio of its sides is 6 : 8 : 10. What is the perimeter of the triangle.

(a) 44 cm. (b) 56 cm.
(c) 64 cm. (d) 48 cm.

SSC CGL 12/12/2022 (Shift-II)

Ans. (d) : Let the sides of triangle be 6x, 8x and 10x

$(10x)^2 = (6x^2) + (8x^2)$

$100x^2 = 100x^2$

Hence the triangle is right angle triangle.

Area of triangle = $\frac{1}{2}$ × Base × Height

$\Rightarrow 96 = \frac{1}{2} \times 6x \times 8x$

$\Rightarrow 96 = 24x^2$

$\Rightarrow x^2 = 4$

$\Rightarrow x = 2$

Perimeter of Δ triangle = 6x + 8x + 10x

= 6×2+8×2+10×2

= 12+16+20

= 48 cm

15. If the side of an equilateral is triangle 16 cm then what is its area?

(a) $64\sqrt{3}$ cm² (b) $81\sqrt{3}$ cm²
(c) $32\sqrt{3}$ cm² (d) $48\sqrt{3}$ cm²

SSC CGL 12/12/2022 (Shift-III)

Ans. (a): Side of an equilateral triangle = 16 cm

Then the area of equilateral triangle

$= \frac{\sqrt{3}}{4}(\text{Side})^2$

$= \frac{\sqrt{3}}{4} \times 16 \times 16 = 64\sqrt{3}$ cm²

16. ΔABC is similar to ΔDEF and the perimeters of these triangles are 32cm and 12cm, respectively. If DE = 6 cm, then what will be the length of AB?

(a) 14 cm (b) 16 cm (c) 12 cm (d) 18 cm

SSC CGL 13/12/2022 (Shift-I)

Ans. (b) : According to the question. Perimeter of ΔABC = 32 cm

Perimeter of ΔDEF = 12 cm

$\because \frac{\text{Perimeter of } \Delta ABC}{\text{Perimeter of } \Delta DEF} = \frac{AB}{DE} = \frac{AC}{DF} = \frac{BC}{EF}$

$\frac{32}{12} = \frac{AB}{6}$

AB = 16cm

17. 'O' is a point in the interior of an equilateral triangle. The perpendicular distance from 'O' to the sides are $\sqrt{3}$ cm, $2\sqrt{3}$ cm, $5\sqrt{3}$ cm. The perimeter of the triangle is :

(a) 48cm (b) 64cm
(c) 32cm (d) 24cm

SSC CGL 13/12/2022 (Shift-IV)

Ans. (a) : Height of equilateral (h) = $\frac{\sqrt{3}}{2}a$,

Where a = Side.

In an equilateral triangle for any interior point, the sum of the lengths of the perpendiculars is equal to the height of the equilateral triangle.

$\because h = p_1 + p_2 + p_3$ (Where P_1, P_2, and P_3 are perpendicular distance)

$\therefore \frac{\sqrt{3}}{2}a = \sqrt{3} + 2\sqrt{3} + 5\sqrt{3}$

$\Rightarrow \frac{\sqrt{3}}{2}a = 8\sqrt{3}$

$\boxed{a = 16}$ cm

Hence, the Perimeter of an equilateral triangle = 3a = 3 × 16 = 48 cm

18. The area of a triangle is 480 cm² and the ratio of its sides is 10 : 24 : 26. What is the perimeter of the triangle?

(a) 120 cm (b) 60 cm
(c) 30 cm (d) 150 cm

SSC CGL 01/12/2022 (Shift-IV)

Ans. (a) : Let side of triangle be 10x, 24x and 26x respectively

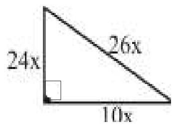
$(26x)^2 = (24x)^2 + (10x)^2$

$676x^2 = 676x^2$

Hence it is right angle triangle

According to the question,

$\frac{1}{2} \times 10x \times 24x = 480$



$x^2 = 4$

$x = 2$

Hence, the Perimeter of triangle = 10x+24x+26x = 60x = 120 cm

19. If the area of similar triangles ΔABC and ΔDEF are x^2 cm² and y^2 cm² respectively, and EF = a cm, then BC (in cm)________ is :

(a) $\frac{ax}{y}$ (b) $\frac{y^2}{a^2x^2}$
(c) $\frac{y}{ax}$ (d) $\frac{a^2x^2}{y^2}$

SSC CGL 01/12/2022 (Shift-II)

Ans. (a) : $\because$ ΔABC ~ ΔDEF,

$\frac{\text{Area of } \Delta ABC}{\text{Area of } \Delta DEF} = \left(\frac{BC}{EF}\right)^2$

@apna_pdf

$$\frac{x^2}{y^2} = \left(\frac{BC}{a}\right)^2$$

$$\frac{x}{y} = \frac{BC}{a}$$

$$BC = \frac{ax}{y}$$

20. If the side of an equilateral triangle is 24 cm, then what is its area?

(a) $144\sqrt{3}$ cm^2 (b) $125\sqrt{3}$ cm^2

(c) $169\sqrt{3}$ cm^2 (d) $256\sqrt{3}$ cm^2

SSC MTS 01/09/2023 (Shift I^st^)

Ans. (a) : Area of an equilateral triangle $= \frac{\sqrt{3}}{4} \times (a)^2$

$$= \frac{\sqrt{3}}{4} \times 24 \times 24$$

$$= 144\sqrt{3} \text{ cm}^2$$

21. If the areas of two similar triangles are in the ratio 196:625, then what is the ratio of the corresponding sides of these two triangles?

(a) 13:20 (b) 13:25

(c) 14:20 (d) 14:25

SSC CGL (Mains) 03/03/2023

Ans. (d) ∵ Triangle are similar

∴ The ratio of the area of triangle will be square of the ratio of their corresponding sides

Hence required ratio $= \sqrt{\frac{196}{625}}$

$= 14 : 25$

22. The centroid of an equilateral triangle ΔPQR is L. If PQ = 18 cm, then the length of PL is:

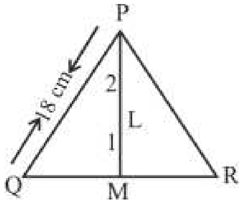
(a) $6\sqrt{3}$ cm (b) $3\sqrt{3}$ cm

(c) $5\sqrt{3}$ cm (d) $4\sqrt{3}$ cm

SSC CGL (Mains) 06/03/2023

Ans. (a) : According to the question,

Altitude of equilateral triangle $= \frac{\sqrt{3}}{2} a$



The centroid divides the median in the ratio 2 : 1

Hence $PL = \frac{\sqrt{3}}{2} \times 18 \times \frac{2}{3}$

$= 6\sqrt{3}$ cm

23. If the sides of a triangle 3 cm, 4 cm and 5 cm. Find its area:

(a) 6 cm^2 (b) 8 cm^2

(c) 10 cm^2 (d) 12 cm^2

SSC CHSL –25/05/2022 (Shift-III)

Ans. (a) : Let sides of triangle be a, b and c.

Then a = 3 cm, b = 4 cm and c = 5 cm

a + b + c = 3 + 4 + 5 = 12 cm

$S = \frac{a+b+c}{2} = \frac{12}{2} = 6$ cm

Area of triangle $= \sqrt{s(s-a)(s-b)(s-c)}$

$= \sqrt{6(6-3)(6-4)(6-5)}$

$= \sqrt{6 \times 3 \times 2 \times 1} = \sqrt{36}$

= 6 cm^2

hence the area of the triangle = 6 cm^2

24. The lengths of the three sides of a triangle are in the ratio of 2 : 2: 3. If the perimeter of the triangle is 42 cm, then what is the largest side?

(a) 12 cm (b) 15 cm

(c) 18 cm (d) 20 cm

SSC MTS 11/07/2022 (Shift-I)

Ans. (c) : According to the question

2x + 2x + 3x = 42

7x = 42

x = 6

Largest side = 3x = 3 × 6

= 18 cm

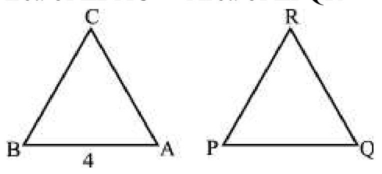
25. Triangle BAC, is similar to triangle PQR. The area of triangle BAC and triangle PQR is 25 cm^2 and 36 cm^2 respectively. If BA = 4 cm, then what is the length of PQ?

(a) 4.8 cm (b) 5 cm

(c) 5.8 cm (d) 4.2 cm

SSC CGL (Tier-II) 08/08/2022 (Shift-I)

Ans. (a): Area of ΔBAC = Area of ΔPQR



$$\frac{\text{Area of } \Delta BAC}{\text{Area of } \Delta PQR} = \frac{(BA)^2}{(PQ)^2}$$

$$\frac{BA}{PQ} = \sqrt{\frac{\text{Area of } \Delta BAC}{\text{Area of } \Delta PQR}}$$

$$\frac{4}{PQ} = \sqrt{\frac{25}{36}}$$

$$PQ = \frac{6 \times 4}{5} = 4.8\text{cm}$$

26. PQR is an equilateral triangle and the centroid of triangle PQR is point A. If the side of the triangle is 12 cm, then what is the length of PA?

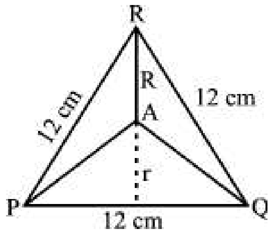
@apna_pdf

(a) $8\sqrt{3}$ cm (b) $4\sqrt{3}$ cm

(c) $2\sqrt{3}$ cm (d) $\sqrt{3}$ cm

SSC CGL (Tier-II) 08/08/2022 (Shift-I)

Ans. (b) :



Circumradius of equilateral triangle $(R) = \frac{a}{\sqrt{3}}$

$= \frac{12}{\sqrt{3}}$

$= 4\sqrt{3}$ cm

27. The area of a right-angled triangle is 42 cm^2. If its perpendicular distance is equal to 10 cm, find the length of its base.

(a) 8.0 cm (b) 8.4 cm

(c) 4.8 cm (d) 4.0 cm

SSC CHSL –06/06/2022 (Shift-III)

Ans. (b) : Area = 42 cm^2

According to the question,

$\frac{1}{2} \times \text{Base} \times \text{Height} = 42$

$\frac{1}{2} \times \text{Base} \times 10 = 42$

$\text{Base} = \frac{42}{5}$

Base = 8.4

28. The length of the hypotenuse of a right-angled triangle is 37 cm and the length of one of its other two sides is 12 cm. What is the area of the triangle?

(a) 216 cm^2 (b) 204 cm^2

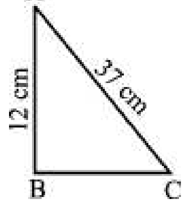
(c) 210 cm^2 (d) 222 cm^2

SSC CHSL –09/06/2022 (Shift-III)

Ans. (c) : According to the question,

AC = 37 cm

AB = 12 cm



$BC = \sqrt{(37)^2 - (12)^2}$

$= \sqrt{1369 - 144} = \sqrt{1225}$

BC = 35 cm

Hence the area of triangle $= \frac{1}{2} \times \text{Base} \times \text{Height}$

$= \frac{1}{2} \times 35 \times 12$

= 6 × 35 = 210 cm^2

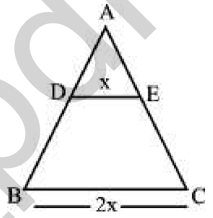
(c) 35 (d) 25

SSC CPO SI 11/11/2022 (Shift IIIrd)

Ans. (b) : In equilateral Δ ABC

Let AB = BC = CA = 2x

According to the question, $DE = \frac{BC}{2} = x$



In similar triangle ΔADE and ΔABC

$\frac{AD}{AB} = \frac{DE}{BC} \Rightarrow \frac{AD}{2x} = \frac{x}{2x} \Rightarrow AD = x$

$\frac{AD}{AB} = \frac{AE}{AC} \Rightarrow \frac{x}{2x} = \frac{AE}{2x} \Rightarrow AE = x$

BD = 2x – x = x, CE = 2x – x = x

Given,

AD + CE + BC = 30

x + x + 2x = 30 ⇒ x = 7.5 cm

Perimeter of quadrilateral BCED = DE + CE + BC + BD

= x + x + 2x + x

= 5x = 5 × 7.5

= $\boxed{37.5\text{cm}}$

$\because$ Sides 15 cm and 20 cm make right angle triangle

So, by Pythagoras theorem

Ans.(a) : Let, the length of perpendicular and base of given isosceles right angle triangle = x

Then area of given triangle = $\frac{1}{2}\times x\times x = 676$

$x^2 = 676\times 2 = 1352$ ——— (i)

From Pythagoras theorem,

Hypotenuse = $\sqrt{x^2+x^2} = \sqrt{2x^2}$

From equation (i),

Ans. (d) : Let the each side of equilateral triangle = a cm

Sum of each side of triangle = 3 × a = $15\sqrt{3}$

$a = \frac{15\sqrt{3}}{3} = 5\sqrt{3}$

61. Two sides of a triangle are 12.8 m and 9.6 m. If the height of the triangle is 12 m, corresponding to 9.6 m, then what is its height (in m) corresponding to 12.8 m?

(a) 8 (b) 10

(c) 9 (d) 12

SSC CHSL 13/04/2021 (Shift-II)

Ans. (c) : Let the height corresponding to 12.8m = x m

From the formula-

$\because$ Area of triangle = $\frac{1}{2}\times$ Base $\times$ height

(a) 14 cm (b) 13 cm

(c) 11 cm (d) 12 cm

SSC CHSL 19/04/2021 (Shift-III)

Ans. (b) : Let the altitude of a triangle = x cm

then base of triangle = x – 3 cm

@apna_pdf

Area of triangle = $\frac{1}{2}\times x\times(x-3)=104$

$x(x-3) = 104\times2 = 208$

$x^2-3x-208 = 0$

$x^2-16x+13x-208 = 0$

$x(x-16) + 13(x-16) = 0$

Let equal side of triangle is a cm.

Perimeter = 2a+b = 36 cm ....(i)

Height (AD) = 6 cm = $\frac{\sqrt{4a^2 - b^2}}{2}$

On squaring both sides,

$36\times 4 = (2a+b)(2a-b)$

$2a - b = 4$ ....(ii)

From equations (i) and (ii)

a = 10 cm, b = 16 cm

∴ Area of an isosceles triangle = $\frac{b}{4}\sqrt{4a^2 - b^2}$

SSC CHSL –18/03/2020 (Shift-I)

Ans. (a) ∵ One side of the triangle = 7

∴ Sum of other two sides = (18–7) = 11

Let the second side = x

Third side = (11–x)

Semi perimeter = $\frac{18}{2} = 9$

Area of triangle = $\sqrt{108}$

$\therefore \sqrt{9\times(9-7)(9-x)(9-11+x)} = \sqrt{108}$

$\sqrt{9\times 2\times(9-x)(x-2)} = \sqrt{108}$ (on squaring both sides)

$(9-x)(x-2) = 6$

$9x - 18 - x^2 + 2x = 6$

$x^2 - 11x + 24 = 0$

$x^2 - 8x - 3x + 24 = 0$

$(x-8)(x-3) = 0$

$x-8 = 0 \Rightarrow x = 8$

(a) 11 (b) 15 (c) 13 (d) 12

SSC CPO SI 9/11/2022 (Shift I[st])

Ans. (c) : Let non - parallel sides = x cm

Area $= \frac{1}{2} \times$ Height × Sum of parallel sides

$180 = \frac{1}{2} \times h \times 30$

h = 12 cm

SSC CGL–(Tier-I) 13/08/2021 (Shift III)

Ans. (a) : According to the question,

Area of circular park = 12474 m² (given)

$\Rightarrow \pi r^2 = 12474$

$\Rightarrow \Rightarrow r^2 = 12474 \times \frac{7}{22}$

$\Rightarrow r^2 = 81 \times 49$

$\Rightarrow r = 9 \times 7$

r = 63 m

New radius with the width of the park (R) = 63m + 3.5 m

= 66.5 m

∴ Area of the path = Area of the park with path–Area of the park

$= \pi R^2 - \pi r^2$

$= \frac{22}{7} \times 66.5 \times 66.5 - 12474$

= 13898.5 – 12474

= 1424.5 m²

$a^2 = 4^2 \times 7^2$

$a = 4 \times 7 = 28$ cm

Area of circle = πr^2

$\because r = \frac{a}{2} = \frac{28}{2} = 14\text{cm}$

(a) 9.5 (b) 15.2
(c) 3.5 (d) 11.6

SSC CHSL 16/04/2021 (Shift-I)

$x^2 + 2x - 5 = 0$

$$x = \frac{-2 \pm \sqrt{4+20}}{2}$$

155. Two small circular grounds of diameters 42 m and 26 m are to be replaced by a bigger circular ground. What would be the radius of the new ground if the new ground has the same area as the two small grounds?

(a) 25.01 m (b) 24.69 m
(c) 25 m (d) 23 m

SSC CHSL –18/03/2020 (Shift-III)

Ans. (b) : $2r_1 = 26$ m., $2r_2 = 42$ m.

$r_1 = 13$ m. $r_2 = 21$ m.

Let the radius of the bigger circular ground is R.

∴ $\pi r_1^2 + \pi r_2^2 = \pi R^2$

$(13)^2 + (21)^2 = R^2$

$169 + 441 = R^2$

$R = \sqrt{610}$ ⇒ R = 24.69

Hence the radius of the bigger circular ground is 24.69 m.

SSC MTS 22/08/2019 (Shift-II)

Ans. (d) : When the wire is bent in the form of a circle

Area of the circle = 3118.5

$\pi r^2 = 3118.5$

$\frac{22}{7} \times r^2 = 3118.5$

$r^2 = \frac{3118.5 \times 7}{22}$

$r^2 = 992.25$

$r = 31.5$

Ans. (a) : Let the side of a square = a cm

$\because a^2 = 144$

Diagonal of the original square $= 12\sqrt{2}$

The perimeter of the square formed by diagonal $= 4\times12\sqrt{2} = 48\sqrt{2}$

185. The diagonal of a square is equal to the side of an equilateral triangle. If the area of the square is $18\sqrt{3}$ sq.cm. What is the area (in cm^2) of the equilateral triangle?

(a) $54\sqrt{2}$ (b) $27\sqrt{2}$

(c) 54 (d) 27

SSC MTS 14/08/2019 (Shift-III)

Ans. (d) : If the measure of the side of the square is a cm, then the length of the diagonal of the square = $a\sqrt{2}$ cm, and side of equilateral triangle = x

According to the question,

$a\sqrt{2} = x \Rightarrow a^2 = x^2/2$ ....(i)

and, $a^2 = 18\sqrt{3}$

$\frac{x^2}{2} = 18\sqrt{3}$ (Substituting the value of a form equation (i))

$x^2 = 36\sqrt{3}$

$\because$ Area of an equilateral triangle $= \frac{\sqrt{3}}{4}x^2$

(a) 1 : 2 (b) $\sqrt{2}$: 3

(c) 1 : 3 (d) 1 : $\sqrt{2}$

SSC MTS 06/08/2019 (Shift-I)

Ans. (d) : If the length of the side of a square is a, then the inradius of the square (r) = a/2

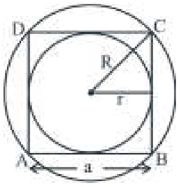
$\therefore \frac{r}{R} = \frac{a/2}{a/\sqrt{2}} = 1:\sqrt{2}$



187. The diagonal of a square is 14cm. What will be the length of the diagonal of the square whose area is double of the area of first square?

(a) $28\sqrt{2}$ cm. (b) $14\sqrt{2}$ cm.

(c) 28 cm. (d) $21\sqrt{2}$ cm.

SSC GD Constable 14/02/2019 (Shift-II)

Diagonal of the square $= a\sqrt{2}$ where a is the side of the square.

Hence, $a\sqrt{2} = 14$cm

$a = \frac{14}{\sqrt{2}} = 7\sqrt{2}$cm

The diagonal of a square with twice the area of this square $= 2\times7\sqrt{2} = 14\sqrt{2}$cm

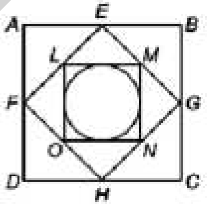
(a) 98 (b) 196

(c) 122.5 (d) 171.5

SSC CGL (Tier-II) 20-02-2018

Ans. (b) :



$\because$ Area of the circle $= \pi r^2$

$38.5 = \frac{22}{7}\times r^2$

$r = \frac{7}{2}$

$\therefore$ Sides of square LMNO = 2r = 7 cm

$\because$ The area of a square formed by joining the mid-points of the sides of a square is half of the original square.

(a) 95 cm (b) 60 cm
(c) 110 cm (d) 120 cm

SSC MTS 19/07/2022 (Shift-III)

Ans. (d): According to the question,

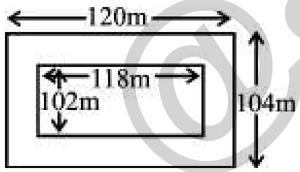
Thus, the outside edges of the path run along the boundary wall of the park. The inside edges of the path are marked with a white line of negligible thickness. If it costs ₹2.50 to mark each metre with the white line, then how much would it cost (in ₹) to fully mark the inside edges of the path?

(a) 1090 (b) 1080
(c) 1120 (d) 1100

SSC CGL (Mains) 02/03/2023

Ans. (d) :



Perimeter of inner edge of the path = $2(l+b)$

$= 2(118+102) = 440$ m

(a) 35 cm (b) 31 cm
(c) 39 cm (d) 34 cm

SSC MTS 09/05/2023 (Shift Ist)

Ans. (d) : Let the length and breadth be l and b respectively

According to the question

Area of rectangular LCD = 480 cm²

$l.b = 480 \text{ cm}^2$ ……………(i)

And perimeter = $2(l + b)$

$92 = 2(l + b)$

$l + b = 46$ cm ……………(ii)

∵ $(l + b)^2 = l^2 + b^2 + 2lb$

$(46)^2 = l^2 + b^2 + 2 \times 480$ [from eq^n (i) & (ii)]

$2116 - 960 = l^2 + b^2$

$l^2 + b^2 = 1156$

∴ Diagonal of rectangular LCD = $\sqrt{l^2 + b^2}$

$= \sqrt{1156}$

$\sqrt{x^2 + y^2} = \frac{4x + 4y - x}{4}$

$\sqrt{x^2 + y^2} = \frac{3x + 4y}{4}$

On squaring both sides

$16x^2 + 16y^2 = 9x^2 + 16y^2 + 24xy$

$7x^2 = 24xy$

$\frac{x}{y} = \frac{24}{7}$

$2800 = 2700 + 180x + 60x + 4x^2 - 2700$

$2800 = 4x^2 + 240x$

$700 = x^2 + 60x$

$x^2 + 60x - 700 = 0$

$x^2 + 70x - 10x - 700 = 0$

(c) 3620 sq. cm (d) 3520 sq. cm

SSC CPO-SI – 12/12/2019 (Shift-II)

Ans. (a) : Circumference of the circular wire = $2 \times \frac{22}{7} \times \frac{77}{2}$ = 11 × 22 cm

Let the breadth of the rectangle formed by bending the wire = x cm

and length of the rectangle $= x \times \frac{142}{100} = \frac{71x}{50}$

According to the question,

Circumference of the circular wire = Perimeter of rectangle

$11 \times 22 = 2\left(x + \frac{71x}{50}\right)$

$121 \times 50 = 50x + 71x$

$x = \frac{121 \times 50}{121} = 50$cm

(a) 9900 (b) 8925
(c) 9240 (d) 9504

SSC CHSL (Tier-I) 03/07/2019 (Shift-III)

Ans. (a): Perimeter of the park $= \frac{21200}{53} = 400$ metre

Let breadth of the park is x metre then length = (x + 20) metre

@apna_pdf

Perimeter of the park = 2 (length + breadth)

$2(x + 20 + x) = 400$

$(\ell - b)^2 + 4 \times 375 = 1600$

(a) 196 cm^2 (b) 188 cm^2

(c) 204 cm^2 (d) 216 cm^2

SSC MTS 04/05/2023 (Shift I[st])

Ans. (d) : $\because$ Area of rhombus $= \frac{1}{2} \times d_1 d_2$

(Where d_1 and d_2 are diagonals)

$= \frac{1}{2} \times 24 \times 18$

$= 12 \times 18 = 216 \text{ cm}^2$

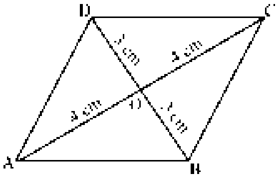
243. The lengths of two diagonals of a rhombus are 6 cm and 8 cm . What is the side (in cm) of the rhombus?

(a) 5 (b) 10 (c) $5\sqrt{2}$ (d) $10\sqrt{2}$

SSC MTS 11-10-2017 (Shift-I)

SSC MTS 10/05/2023 (Shift IInd)

Ans: (a)



In Rhombus ABCD

AB = BC = CD = AD

$\because$ Diagonal BD = 6 cm

$\therefore OB = OD = \frac{6}{2} = 3$ cm

Diagonal CA = 8 cm

$OA = OC = \frac{8}{2} = 4$ cm

Δ DOC is a right angle triangle.

$\therefore DC^2 = OD^2 + OC^2$

$DC^2 = 3^2 + 4^2$

$DC^2 = 25$

DC = 5

Hence side of rhombus = 5 cm

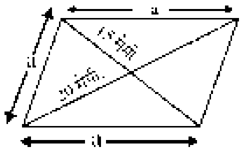
Diagonal $(d_1) = 15$ cm

$(d_2) = 20$ cm

Area of rhombus $A = \frac{d_1 \times d_2}{2}$

$= \frac{15 \times 20}{2}$

A = 150 cm^2



245. The lengths of two diagonals of a rhombus are 15 cm and 20 cm What is the area (in cm^2) of the rhombus?

246. The diameter of a circle is 7/4 times of the base of a triangle, and the height of the triangle is 14 cm. If the area of the triangle is 56 cm², then what is the circumference (in m) of the circle? $\left(\text{use } \pi = \frac{22}{7}\right)$

(a) 1.74m (b) 0.48m
(c) 2.46m (d) 0.44m

SSC MTS 08/05/2023 (Shift IInd)

Ans. (d) : Given,

Height of triangle (h) = 14 cm

Area of triangle = 56 cm²

Let, the base of triangle = x cm

$$\text{Area of triangle} = \frac{1}{2} \times \text{Base} \times \text{Height}$$

$$56 = \frac{1}{2} \times x \times 14$$

x = 8 cm

$$\text{Diameter of circle } (2r) = \frac{7}{4} \times 8$$

Radius of circle (r) = 7 cm

Circumference of circle = $2\pi r$

$$= 2 \times \frac{22}{7} \times 7 = 44 \text{ cm}$$

$$= \frac{44}{100} m = 0.44m$$

247. What is the Circumference of the largest circle which can be inscribed in a square of side 14 cm?

(a) 66 cm (b) 88 cm
(c) 22 cm (d) 44 cm

SSC MTS 04/05/2023 (Shift I[st])

Ans. (d) :

∵ Side of square = 14 cm

∴ Diameter of circle = 14 cm

$$\text{Radius of circle} = \frac{14}{2} = 7 \text{ cm}$$

then circumference of circle $= 2\pi r$

$$= 2 \times \frac{22}{7} \times 7 = 44 \text{cm}$$

248. If the circumference of a circle is equal to the perimeter of a square, and the radius of the given circle is positive, then which of the following options is correct?

(a) Area of circle < Area of Square
(b) Area of circle ≥ Area of Square
(c) Area of circle < Area of Square
(d) Area of circle = Area of Square

SSC MTS 12/07/2022 (Shift-III)

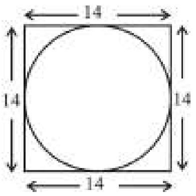
Ans. (c) : Let the radius of circle is r and the side of square is a.

Circumference of circle = Perimeter of square

According to the question,

$$2\pi r = 4a$$

$$\frac{r}{a} = \frac{2}{\pi}$$



$$= \frac{\text{Area of circle}}{\text{Area of Square}} = \frac{\pi r^2}{a^2}$$

$$= \pi\left(\frac{2}{\pi}\right)^2$$

$$= \frac{4}{\pi} = \frac{4}{\frac{22}{7}} = \frac{28}{22}$$

Hence from the above it is clear that Area of the Circle > Area of the Square

249. The side of an equilateral triangle is 12 cm. What is the radius of the circle circumscribing this equilateral triangle?

(c) $8\sqrt{3}$ cm (d) $4\sqrt{3}$ cm

SSC CGL (Tier-II) 08/08/2022 (Shift-I)

Ans. (d) : Side of equilateral triangle (a) = 12 cm

The radius of a circle circumscribing an equiateral triangle $= (r) = \frac{a}{\sqrt{3}}$

$$= \frac{12}{\sqrt{3}}$$

$$= 4\sqrt{3} \text{ cm}$$

250. A wire is in the form of a square of side 33 cm. If the wire is molded to form a circle, then what is the radius of the circle? $\left(\text{use } \pi = \frac{22}{7}\right)$

(a) 21 cm (b) 33 cm
(c) 16.5 cm (d) 42 cm

SSC MTS 03/05/2023 (Shift IInd)

Ans. (a): Circumference of circle = Perimeter of square

$2\pi r = 4 \times 33$

$$2 \times \frac{22}{7} \times r = 4 \times 33$$

r = 21 cm

Circumference of circle = Perimeter of square

$2 \times \frac{22}{7} \times 7 = 4 \times a$

$= (11)^2$

$= 121\ cm^2$

252. The perimeter of a square is 64 cm. The area of a rectangle is 16 cm^2 less than the area of the square. If the length of the rectangle is 20 cm. What is the perimeter of the rectangle?

(a) 18 cm (b) 64 cm (c) 12 cm (d) 15 cm

SSC GD Constable 07/02/2023 (Shift I[st])

Ans. (b) : Given that-

Perimeter of square (4a) = 64 cm

then side $= \frac{64}{4} = 16$ cm

Area of square $= (\text{side})^2 = (16)^2 = 256\ cm^2$

According to the question,

Area of rectangle = 256 – 16 = 240 cm

Length of rectangle (l) = 20 cm

Area of rectangle $= l \times b$

240 = 20 × b

b = 12 cm

Hence, the perimeter of rectangle $= 2(l + b)$

Same as, $\frac{ar(\Delta QDC)}{ar(\Delta PQR)} = \frac{10}{80} = \frac{1}{8}$

$ar(\Delta PQR) = \frac{1}{2} \times 8 \times \sqrt{100-16} = 8\sqrt{21}\ cm^2$

Hence the total area of the three sectors will be equal of semi circle's area.

area of the three circles =

SSC CPO-SI 24/11/2020 (Shift-I)

(a) 444 (b) 853.2
(c) 308.64 (d) 548.32

SSC CPO-SI 24/11/2020 (Shift-I)

A semi circle is drawn around the rectangle

Area of the circle $= \pi r^2$

Area of the rectangle $= a \times b$

Hence total area of the lawn = Area of circles + Area of rectangles

$$= \pi\times(12)^2 + \pi\times(6)^2 + (24\times 12)$$

$2\pi r = 4a$
$4a = 2\times\frac{22}{7}\times28 = 176$ where a = Side of a square

Ans. (d) : Triplet → (20, 21, 29) × 20

Hence 400, 420 and 580 are the sides of right angle triangle.

Area of the triangle $\Delta = \frac{1}{2}\times 420\times 400$

$\Delta = 210 \times 400$

$\Delta = 84000 \text{ m}^2$

Area of the circular ground $= 84000\times\frac{220}{3}\times\frac{1}{100}$

$\pi r^2 = 280\times 220$

$\frac{22}{7}r^2 = 280\times 220$

$r^2 = 280 \times 10 \times 7$

$r^2 = 7\times4\times10\times10\times7$

$r = 7\times10\times2 = 140$

∴ Circumference of the circular ground $= 2\pi r$

$= 2\times\frac{22}{7}\times 140 = 880$ m

(c) 12 cm, 16 cm and 20 cm
(d) 18 cm, 24 cm and 30 cm

SSC CGL (Tier-I) 20/07/2023 (Shift-I)

Ans. (a): Let the side of cube is 3a, 4a and 5a respectively.
Volume of new cube $= (3a)^3 + (4a)^3 + (5a)^3 = 216a^3$
Side of new cube = 6a
Diagonal of new cube $= 18\sqrt{3}$ cm
$6a \times \sqrt{3} = 18\sqrt{3}$
a = 3
Hence, sides of cube $\rightarrow 3 \times 3, 4 \times 3, 5 \times 3$
= 9 cm, 12 cm, 15 cm

Ans. (d) : Given that-
Length of the large cube = 48 cm
Volume of the large cube = $(48 \times 48 \times 48)$ cm^3

$96 = 6a^2$
$\Rightarrow a^2 = 16$
$\Rightarrow a = 4$m
Length of diagonal of the cube $= a\sqrt{3}$
$= 4\sqrt{3}$ m

SSC CHSL Tier- II 26/06/2023

Ans.(b): Total surface area of cube $= 6a^2 = 6 \times 5^2 = 150$ cm^2
The overall surface area of the remaining solid is $= 150 - 6 \times 1 + 5 \times (1)^2 \times 6$
$= 150 - 6 + 30 = \boxed{174}$ cm^2

(a) $91.98\ cm^3$ (b) $96.98\ cm^3$
(c) $90.69\ cm^3$ (d) $99.96\ cm^3$

SSC CGL 05/12/2022 (Shift-I)

Ans. (a) : Side of cube(a) = 5.6 cm

$$\text{Radius of sphere (r)} = \frac{5.6}{2}\ cm = 2.8\ cm$$

Hence, Volume of sphere $= \frac{4}{3}\pi r^3$

$$= \frac{4}{3}\times\frac{22}{7}\times 2.8\times 2.8\times 2.8 = 91.98\ cm^3$$

a = 6cm
Length of cuboid when three cubes are joined
(l) = 6 × 3 = 18 cm
Breadth (b) = 6 cm
Height (h) = 6 cm
Required surface area of cuboid = 2(lb + bh + lh)
= 2(18 × 6 + 6 × 6 + 6 × 18)
= 2(108 + 108 + 36)
= (252)×2 = $504\ cm^2$

11. The ratio of the total surface area of the cubes is 49 : 81. What is the ratio of their volumes?

(a) 49 : 121 (b) 343 : 729

And the side of second cube = a_2
According to the question :

$6a_1^2 : 6a_2^2 = 49 : 81$

$a_1^2 : a_2^2 = 49 : 81$

$a_1 : a_2 = 7 : 9$

Ratio of volumes of cubes
$(a_1)^3 : (a_2)^3 = (7)^3 : (9)^3 = 343 : 729$

(a) 6 (b) 2 (c) 5 (d) 4

SSC CGL 11/04/2022 (Shift-I)

Ans. (d) : Let the height of water level will rise = x cm
According to the question,
Volume of cube = Volume of rectangular container
$(a)^3 = l \times b \times h$
$(8)^3 = 16 \times 8 \times x$

$x = \frac{512}{128}$

$\boxed{x = 4cm}$

(a) 5.57 (b) 7.75
(c) 7.57 (d) 5.77

SSC Selection Posts XI-28/06/2023 (Shift-III)

Ans. (d) : ∵ Length of diagonal of cube = Maximum length of rod.
$= \sqrt{3}\times$ Side
$\therefore \sqrt{3}\times$ Side = 10

$\therefore$ Side of cube $= \frac{10}{\sqrt{3}} = \frac{10}{1.732} = 5.77$ m

14. If the lateral surface area of cube is 144 cm^2. Then what is the length of its side?

(a) 4 cm (b) 8 cm
(c) 5 cm (d) 6 cm

SSC GD Constable 09/02/2023 (Shift IIIrd)

Ans. (d) : Lateral surface area of cube = $4a^2$
Now, According to the question -
⇒ $4a^2 = 144$
$a^2 = 36$
Side of cube (a) = 6 cm

(a) $96\ cm^2$ (b) $82\ cm^2$
(c) $88\ cm^2$ (d) $64\ cm^2$

SSC CHSL 01/06/2022 (Shift- III)

Ans. (a) : Volume of cube = a^3
$a^3 = 64 = 4^3$
a = 4 cm,
∵ Total surface area of cube = $6a^2$
∴ Total surface area of cube = $6 \times (4)^2 = 96\ cm^2$

16. From the body of a solid cube of edge 7 cm, a solid sphere is removed. The volume of the remaining solid was found to be $163\frac{1}{3} cm^3$ .What is the diameter (in cm) of the sphere? $\left(\text{Take } \pi = \frac{22}{7}\right)$

(a) 10 (b) 7
(c) 5 (d) 8

SSC CGL (Tier-I) 19/04/2022 (Shift-I)

@apna_pdf

Ans. (b) According to the question,
Volume of solid left = Volume of cube – Volume of sphere

$163\frac{1}{3} = (7)^3 - \frac{4}{3}\pi r^3$

$343 - 163\frac{1}{3} = \frac{4}{3} \times \frac{22}{7} r^3$

$\frac{1029-490}{3} = \frac{4}{3} \times \frac{22}{7} r^3$

$\frac{539}{3} = \frac{4}{3} \times \frac{22}{7} \times r^3$

$\frac{7^3}{2^3} = r^3$

$r = \frac{7}{2} = 3.5$

(Diameter) 2r = 2×3.5 = 7 cm
Hence, the diameter of the sphere is 7cm.

17. The sum of three numbers is 98. If the ratio of the first to the second is 2 : 3 and that of the second to the third is 5 : 8, then the third number is:

(a) 30 (b) 20
(c) 49 (d) 48

SSC CGL (Tier-I) 18/04/2022 (Shift-I)

Ans. (d) Let the three numbers are a, b and c.
a : b → (2 : 3) × 5 = 10 : 15
b : c → (5 : 8) × 3 = 15 : 24
a : b : c → 10 : 15 : 24
a + b + c → 49 unit = 98
1 unit = 2
Hence, third number = 24 unit = 2 × 24 = 48

18. A metal cube of edge 18 cm is melted to form three smaller cubes, which are unequal in dimensions. If the edges of two smaller cubes are 9 cm and 15 cm, what is the surface area in (cm^2) of the third smaller cube?

(a) 1944 (b) 864
(c) 1728 (d) 486

SSC MTS 08/10/2021 (Shift-I)

Ans. (b) :
Volume of bigger cube = [Volume of smaller cubes]
$(18)^3 = (9)^3 + (15)^3 + x^3$
$5832 = 729 + 3375 + x^3$
$x^3 = 5832 - 4104$
$x^3 = 1728\ cm^3$
x = 12 cm.
Now, Surface area of third smaller cube $= 6x^2$
$= 6 \times 144$
$= 864\ cm^2$

19. A solid cube having volume 46656 cm^3 is cut into 27 cubes of equal volume. The surface area (in cm^2) of the smaller cubes is:

SSC CHSL 09/08/2021 (Shift-I)

Ans. (a) :

$\text{Volume of smaller cube} = \frac{\text{Volume of bigger cube}}{\text{No.of smaller cube}}$

$= \frac{46656}{27} = 1728\ cm^3$

Volume of smaller cube = $(side)^3 = (12)^3$
Side of smaller cube = 12 cm
So, Surface area of smaller cube = $6 \times (side)^2$
$= 6 \times 144 = 864\ cm^2$

20. Three cubes each having volume 1728 cm^3 are placed one above the other. What is the total surface area of the resulting solid?

SSC MTS 20/10/2021 (Shift-I)

Ans. (d) : Volume of cube = $(Side)^3 = (a)^3$
$(Side)^3 = 1728\ cm^3$
Side $= \sqrt[3]{1728}\ cm^3$
Side = 12cm
Now,
$l = 12, b = 12, h = 36$
Total surface area $= 2(lb+bh+hl)$
$= 2[(12\times12)+(12\times36)+(36\times12)]$
$= 2(144 + 432 + 432)$
$= 2\times1008$
$= 2016\ cm^2$

Length of side of first cube $(a_1) = 24\ cm$
And volume of second cube,
$8(a_2)^3 = 13824$
$a_2^3 = 1728$
$\boxed{a_2 = 12\ cm}$
According to the question,
Surface area of original cube $= 6a_1^2$
$= 6 \times 24 \times 24$
Surface area of three small cubes $= 3 \times 6a_2^2$
$= 3 \times 6 \times 12 \times 12$

$\frac{\text{Surface area of original cube}}{\text{Surface area of three small cube}} = \frac{4}{3}$

43. The volume of a cuboid is 3300 cm^3. The sum of length and breadth of the cuboid is 37 cm. If the difference between the length and breadth of the cuboid is 13 cm. Then find the height of the cuboid.

(a) 16 cm (b) 14 cm
(c) 11 cm (d) 18 cm

SSC MTS 08/07/2022 (Shift-I)

Ans. (c) : Given that
Volume of cuboid $= lbh = 3300\ cm^3$
According to the question,
$l + b = 37$ cm .....(i)
$l - b = 13$ cm .....(ii)
On adding equation (i) and equation (ii) -
$2l = 50$ cm
$l = 25$ cm
∴ $b = 12$ cm
$lbh = 3300\ cm^3$
$25\ cm \times 12\ cm \times h = 3300\ cm^3$
$h = 11$ cm
Hence, the height of the cuboid is 11 cm.

44. A cuboid with sides 12cm, 18cm, and 27cm is melted to form a cube. What is the ratio of the total surface area of the cuboid to the total surface area of the cube.

(a) 18 : 17 (b) 17 : 23
(c) 19 : 18 (d) 17 : 19

SSC CGL 08/12/2022 (Shift-IV)

Ans. (c) : According to the question,
Volume of cube = Volume of cuboid
$a^3 = lbh$
$a^3 = 12 \times 18 \times 27$
∴ $a = 18$ cm
Now,
∴ Total surface area of cuboid : Total surface area of cube.
$2(lb+bh+lh) : 6a^2$
$\Rightarrow 2(12\times18+18\times27+27\times12) : 6\times(18)^2$
$\Rightarrow 2(216+486+324) : 6\times18\times18$
$\Rightarrow 1026 : 3\times18\times18$
∴ 19 : 18

(c) 1680 cm^3 (d) 1440 cm^3

SSC MTS 7/07/2022 (Shift-III)

Ans. (a) : Volume of metal = External volume – Internal volume
External volume of box $= (15 \times 18 \times 8)$

(a) 208120 cm^3 (b) 280120 cm^3
(c) 288100 cm^3 (d) 288120 cm^3

SSC CGL (Tier-I)-2019 – 09/03/2020 (Shift-I)

Ans. (d) : Let $l = 7x$, $b = 5x$, $h = 3x$

Total surface Area = 27832 cm^2

$2(lb + bh + hl) = 27832$

$71x^2 = 13916$

$x^2 = 196$

$x = 14$

$\therefore$ Volume of box = $l\times b\times h$

$= 105x^3 = 105\times14\times14\times14 = 288120\ cm^3$

70. A cuboid has dimensions 8 cm × 10 cm × 12 cm. It is cut into small cubes of side 2 cm. What is the percentage increase in the total surface area ?

(a) 286.2 (b) 314.32
(c) 250.64 (d) 386.5

SSC CGL (Tier-II) 21-02-2018

Ans. (d) :

Total surface area of cuboid $= 2[(8\times10) + (10\times12) + (12\times8)]$

$= 2[80 + 120 + 96] = 592\ cm^2$

Number of cube of side 2cm $= \dfrac{8\times10\times12}{2\times2\times2} = 120$

Total surface area of cube of side 2cm = $120\times6\times(2)^2$

Hence, Increased percentage in total surface are

$$= \left(\frac{2880-592}{592}\right)\times100$$

$$= \left(\frac{2288}{592}\right)\times100 = 386.48$$

$$= \boxed{386.5\ cm^2}$$

101. The total surface area of a cylinder is 4092 cm² and the diameter of its base is 21cm. What will be 50% of the volume of the cylinder (in cm³) rounded to the nearest integer) ?

(a) 8922 (b) 8932
(c) 8822 (d) 8832

SSC CGL (Tier-II) 29/01/2022 (Shift-I)

Ans. (a) : Total surface area of cylinder = 4092 cm²

$$\text{Radius} = \frac{\text{Diameter}}{2} = \frac{21}{2}$$

Total surface area of cylinder = $2\pi r(r + h)$

$$2\times\frac{22}{7}\times\frac{21}{2}\left(\frac{21}{2}+h\right) = 4092$$

$$\frac{21}{2}+h = \frac{4092\times7\times2}{2\times22\times21}$$

$$h = 62-\frac{21}{2}$$

$$h = \frac{103}{2}$$

∴ 50% of the volume of cylinder = $\pi r^2 h\times 50\%$

$$= \left(\frac{22}{7}\times\frac{21}{2}\times\frac{21}{2}\times\frac{103}{2}\right)\times\frac{1}{2}$$

$= 8922\ cm.^3$

(a) $4\frac{2}{3}$ (b) $3\frac{2}{3}$ (c) 6 (d) 4

SSC CPO SI 9/11/2022 (Shift Ist)

Ans. (a) : Curved surface area of cylinder = 88 cm²

$2\pi rh = 88$ .... (i)

Volume of cylinder = 132 cm³

$\pi r^2 h = 132$ ...... (ii)

Equation (i) ÷ equation (ii)

$$\frac{2\pi rh}{\pi r^2 h} = \frac{88}{132}$$

$$\frac{2}{r} = \frac{88}{132}$$

r = 3 cm
On putting the value of r in equation (i),

$2\pi rh = 88$

$$2\times\frac{22}{7}\times3\times h = 88$$

$$h = \frac{14}{3} = 4\frac{2}{3}\ \text{cm}$$

Hence, the height of the cylindrical object is $4\frac{2}{3}$ cm

3h = 4r

$h = \frac{4r}{3}$

Volume of cylinder $= 4851 \text{ cm}^3$

$\pi r^2 h = 4851$

$\frac{22}{7} \times r^2 \times \frac{4r}{3} = 4851$

158. The radii of two cylinders A and B are in the ratio of 5 : 6 and the heights are in the ratio of 7 : 4 respectively. The ratio of curved surface area of cylinder B to that of A is:

(a) 35 : 24 (b) 24 : 35
(c) 49 : 35 (d) 35 : 49

SSC MTS 14/08/2019 (Shift-III)

Ans. (b) :

$\because r_1 : r_2 = 5 : 6$

and $h_1 : h_2 = 7 : 4$

then $\frac{2\pi r_2 h_2}{2\pi r_1 h_1} = \frac{r_2}{r_1} \times \frac{h_2}{h_1}$

159. The volume of a right circular cylinder is 3 times the volume of a right circular cone. The radius of the cone and the cylinder are 3cm and 6 cm respectively. If the height of the cylinder is 1 cm, then what is the slant height of the cone?

(a) $\sqrt{13}$cm (b) 4 cm
(c) 5 cm (d) 6 cm

SSC MTS 19/08/2019 (Shift-I)

Ans. (c): According to the question

Volume of cylinder = volume of cone × 3

$\pi r^2 h = \frac{1}{3} \times \pi R^2 H \times 3$

$r^2 h = R^2 H$

$(6)^2 \times 1 = (3)^2 \times H$

$36 = 9 \times H$

$H = 4$cm

$\therefore$ The slant height of cone

(c) 10.5 cm (d) 12 cm

SSC CHSL 24/05/2022 (Shift- III)

Ans. (c) : Given, TSA of sphere = 1386 cm^2

Radius of sphere = ?

We know that,

TSA of sphere = $4\pi r^2$

$\Rightarrow 4\pi r^2 = 1386$

$\Rightarrow 4 \times \frac{22}{7} \times r^2 = 1386$

$\Rightarrow r^2 = \frac{1386 \times 7}{22 \times 4}$

$\Rightarrow r = \frac{21}{2}$

$\Rightarrow$ r = 10.5 cm

248. If the volume of a sphere is 4,851 cm^3, then what is its diameter (in cm)? $\left(\text{Take } \pi = \frac{22}{7}\right)$

(a) 18 (b) 16
(c) 12 (d) 21

SSC CGL (Tier-I) 18/04/2022 (Shift-III)

Ans. (d) According to the question,

Volume of sphere = 4851

$\frac{4}{3}\pi r^3 = 4851$

$\frac{4}{3} \times \frac{22}{7} \times r^3 = 11 \times 441$

$r^3 = \frac{11 \times 441 \times 7 \times 3}{4 \times 22}$

$r^3 = \frac{11 \times 21 \times 21 \times 21}{4 \times 2 \times 11}$

$\therefore \boxed{r = \frac{21}{2}}$

$\therefore$ Diameter of sphere = 2r

(c) $675\frac{3}{7}$ (d) $713\frac{1}{7}$

SSC CGL (Tier-I) 18/04/2022 (Shift-I)

(c) 6.2cm (d) 8.2cm

SSC CPO-SI 13/12/2019 (Shift-II)

Ans. (c) Let, Radius of sphere = r cm

Then, surface area of sphere = $4\pi r^2$ cm²

According to the question

$$4\pi(r+5)^2 = 4\pi r^2 + 704$$
$$4\pi(r^2 + 25 + 10r) = 4\pi r^2 + 704$$
$$4\pi r^2 + 100\pi + 40\pi r = 4\pi r^2 + 704$$
$$\pi(100 + 40r) = 704$$
$$100 + 40r = 704\times\frac{7}{22} = 32\times 7$$
$$40r = 224 - 100 = 124$$
$$r = 3.1cm$$

Hence, Diameter of original sphere = 2r = 2 × 3.1 = 6.2cm

(a) 1 (b) $\frac{\pi^2}{36}$ (c) 4 (d) $\frac{36}{\pi^2}$

SSC CHSL –13/10/2020 (Shift-II)

SSC CGL (Tier-II) 29/01/2022 (Shift-I)

Ans. (d) : Sides of triangle are 16, 30 and 34 cm.
From Pythagoras theorem,
$(\text{Hypotenuse})^2 = (\text{Perpendicular})^2 + (\text{Base})^2$
$(34)^2 = (16)^2 + (30)^2$

(a) 20.50 (b) 18.25
(c) 16.25 (d) 19.95

SSC CGL 11/04/2022 (Shift-III)

Ans. (d) : Height of frustum = 35 cm
Radius of the upper base of the frustum (R) = 18 cm
Radius of the lower base of the frustum (r) = 12 cm
Radius of base of the cylindrical drum (r_1) = 20 cm

$\because$ Volume of frustum $= \frac{\pi h}{3}\left(R^2 + r^2 + Rr\right)$

& Volume of cylinder = $\pi r_1^2 h$
According to the question

$$\frac{22}{7}\times\frac{35}{3}\left(18^2+12^2+18\times12\right)=\frac{22}{7}\times\left(20\right)^2\times h$$

$$\Rightarrow \frac{35}{3}\times\left(324+144+216\right)=400\times h$$

$$\Rightarrow \frac{35}{3}\times 684 = 400\times h$$

$$h = \frac{35\times684}{3\times400} = 19.95\text{cm}$$

317. The length, breadth and height of a room are 7m, 4m and 9m respectively. Find the cost of whitewashing the walls of the room and the ceiling at the rate of ₹ 7.50 per m^2?

(a) ₹1,968 (b) ₹1,695
(c) ₹1,698 (d) ₹1,965

SSC CHSL –10/06/2022 (Shift-I)

Ans. (b) : Area of four walls of room
= 2h(l + b)
= 2 × 9 (7 + 4)
= 18 × 11 = 198 m^2
Area of ceiling = l × b = 7 × 4 = 28 m^2
Hence the cost of white washing the walls and ceiling = (28 + 198) × 7.50 = ₹1695

318. How many bricks, of size 25 cm × 11.25 cm × 6 cm, will be needed to build a wall of 8 m × 6 m × 22.5 cm?

(a) 7020 (b) 6800 (c) 6400 (d) 5800

SSC CHSL –26/05/2022 (Shift-I)

Ans. (c) : We know that,
$\because$ Volume of cuboid = Length × Breadth × Height
$\therefore$ Volume of brick = 25 cm × 11.25 cm × 6 cm
= 1687.5 cm^3
And volume of a wall = 800 × 600 × 22.5
= 10800000 cm^3

Hence, number of brick $= \frac{10800000}{1687.5} = 6400$

Slant height of the frustum $(l) = \sqrt{\left[H^2 + (R-r)^2\right]}$

$$= \sqrt{\left[12^2 + \left(\frac{39}{2}-\frac{21}{2}\right)^2\right]}$$

$$= \sqrt{144+81} = \sqrt{225}$$

= 15 m

Curved surface area of tent = Curved surface area of frustum + curved surface area of Hemisphere

$$= \pi l\left(R+r\right)+2\pi r^2$$

$$\pi\left[15\left(\frac{39}{2}+\frac{21}{2}\right)+2\times\frac{441}{4}\right]$$

(a) 2196 (b) 924
(c) 482 (d) 880

Volume of cone $= \frac{1}{3}\pi r^2 h$

$= \frac{1}{3}\pi \times 7^2 \times 7 = \frac{1}{3}\pi \times 7^3$

Volume of each sphere $= \frac{4}{3}\pi r^3 = \frac{4}{3}\pi \times 7^3$

Let the height of cylinder be H

According to the question,

$$\frac{1}{3}\pi \times 7^3 + 2 \times \frac{4}{3}\pi \times 7^3 = \pi \times 7^2 \times H$$

($\because$ volume of cylinder = $\pi r^2 H$)

$$7^3 \pi\left(\frac{1}{3} + \frac{8}{3}\right) = \pi \times 7^2 \times H$$

H = 21 cm

$4 \times \frac{22}{7} r_1^2 = 616$

$r_1^2 = 49$

$\boxed{r_1 = 7 \text{ cm}}$

$\frac{4}{3}\pi r_1^3 = \frac{1}{3} h \pi r_2^2$

$\frac{4}{3} \times \frac{22}{7} \times 7 \times 7 \times 7 = \frac{1}{3} \times 28 \times \frac{22}{7} \times r_2^2$

Number System

(I) Problems based on Divisibility Rule

1. A six-digit number 11p9q4 is divisible by 24. Then the greatest possible value for pq is:

(a) 56 (b) 42 (c) 68 (d) 32

SSC CGL Mains 26/10/2023

Ans. (a) : The number which is divisible by 24, is also divisible by 8 and 3.

Divisibility Rule of 8 : If the number made from last three digits of the given number is divisible by 8 then the number is completely divisible by 8.

Divisibility Rule of 3 : If the sum of the digits of the given number is divisible by 3 then the number will be divisible by 3.

Sum $\rightarrow$ 1+1+p +9+q+4 = 15+p+q

P = 7, q= 8 (maximum value)

So, pq = 7×8 = 56

2. Which of the number from 25560, 35751, 48168 and 49608 is not divisible by 24 ?

(a) 35751 (b) 48168
(c) 25560 (d) 49608

SSC CHSL (Tier-I) 14/08/2023 (Shift-IV)

Ans. (a) : Divisibility Rule of 24:- 24 = 8×3 i.e. The number should be divisible by both 8 and 3.

For the divisibility of 8 the last three digit of number should be divisible by 8 and for the divisibility of 3, the sum of the digits of numbers should be divisible by 3.

So from the given numbers, only 35751 is not divisible by 24.

3. Which of the following numbers is not divisible by 11?

(a) 1735624 (b) 752563
(c) 1904529 (d) 1661308

SSC CHSL (Tier-I) 02/08/2023 (Shift-I)

Ans. (b) : Divisibility rule of 11:- If the difference between the sum of the digits at even places and the sum of the digits at odd places of the number is '0' (zero) or is divisible by '11' then that number is also divisible by 11.

From option (b) .

752563 = (7+2+6) –(5+5+3) = 15–13= 2

2 is not divisible by 11, hence the number is not divisible by 11.

4. Find the smallest number which should be added to 888 to make a resulting number completely divisible by 35.

(a) 22 (b) 21
(c) 23 (d) 20

SSC CGL (Tier-I) 18/07/2023 (Shift-III)

Ans. (a) : From option (a),

As per question, 888 + 22 = 910

$= \frac{910}{35}$

= 26

Hence, the smallest number is 22.

5. 846523X7Y is a 9 digit number which is divisible by 9, and Y–X = 6. Find the value of $\sqrt{2X + 4Y}$.

(a) 4 (b) 6 (c) 8 (d) 2

SSC CGL (Tier-I) 26/07/2023 (Shift-II)

Ans. (b) : Given that -

The number 846523X7Y is divisible by 9

$\because$ Y – X = 6

Y = X + 6

So, sum of the numbers,

= 8 + 4 + 6 + 5 + 2 + 3 + X + 7 + Y

= 8 + 4 + 6 + 5 + 2 + 3 + X + 7 + (X + 6)

= 41 + 2X

(41 + 2X) is divisible by 9 for X = 2

So, Y = 2 + 6 = 8

Then, $\sqrt{2X+4Y} = \sqrt{2\times2+4\times8}$

$= \sqrt{36}$

= 6

6. Which number among 98984, 98992, 98998 and 99008 is not divisible by 8.

(a) 99008 (b) 98984
(c) 98998 (d) 98992

SSC CGL (Tier-I) 19/07/2023 (Shift-IV)

Ans. (c) : Divisibility Rule of 8:- If the number made from the last three digits of a number is divisible by 8, then the number is completely divisible by 8.

From option (c) $\frac{998}{8} = 124.75$, the last three digits of the number 98998 is not divisible by 8.

Hence, the number 98998 is not divisible by 8.

7. Which of the following number is divisible by 44?

(a) 93472 (b) 27048
(c) 54736 (d) 32802

SSC CGL (Tier-I) 25/07/2023 (Shift-IV)

Ans. (c) : The number which is divisible by 44 will also be divisible by 11 and 4.

Divisibility rule of 11:- If the difference between the sum of the digits at even places and the sum of the digits at odd places of the number is '0' or is divisible by '11' then that number is divisible by 11.

Divisibility rule of 4 :- If the number made from last two digits of the given number is divisible by 4 then that number is also divisible by 4.

From option (c), 54736

$= (5+7+6) - (4+3) = 18-7 = 11$

The number is divisible by 11.

Number made from last two digits of the given number $= \frac{36}{4} = 9$ is also divisible by 4.

Hence, option (c) is completely divisible by 44.

8. When m is divided by 7, the remainder is 5. When 3m is divided by 7, what will be the remainder ?

(a) 3 (b) 2 (c) 1 (d) 0

SSC CGL (Tier-I) 19/07/2023 (Shift-IV)

Ans. (c) : Let the quotient be 1.

From the formula m = 7 + 5 = 12

Divided = divisor × Quotient + Remainder

$m = 7 \times 1 + 5$

$m = 12$

Now, $3m = 3 \times 12 = 36$

So, $\frac{36}{7}$, R = 1

Hence remainder is 1

9. How many of the following numbers are divisible by 3 but NOT by 9 ?
5826, 5964, 6039, 6336, 6489, 6564, 6867 and 6960

(a) 5 (b) 4 (c) 6 (d) 3

SSC CGL (Tier-I) 27/07/2023 (Shift-III)

Ans. (b) : **<u>Divisibility Rule of 3 :-</u>** If the sum of the digits of a number is divisible by 3 then that number will be divisible by 3.

<u>Divisibility rule of 9:-</u> If the sum of the digits of number is divisible by 9, then that number will be divisible by 9.

5826 → 5+8+2+6= 21 (Divisible by 3 but not by 9)

5964 → 5+9+6+4= 24 (Divisible by 3 but not by 9)

6564 → 6+5+6+4= 21 (Divisible by 3 but not by 9)

6960→ 6+9+6+0 = 21 (divisible by 3 but not by 9)

So, there are four numbers which are divisible by 3 but not by 9 while as the remaining numbers are divisible by both.

10. Which of the following number is divisible by 11?

(a) 63962 (b) 56923
(c) 97174 (d) 17295

SSC CGL (Tier-I) 20/07/2023 (Shift-I)

Ans. (c) : From option (c),

$97174 = (9 + 1 + 4) - (7 + 7)$

$= 14 - 14 = 0$

Hence, the number 97174 is divisible by 11

11. Which of the following numbers is not divisible by 4?

(a) 67547172 (b) 80936292
(c) 56783294 (d) 73568916

SSC Selection Posts XI-27/06/2023 (Shift-III)

Ans. (c) : If the last two digits of any number is divisible by 4 then that number will be completely divisible by 4.

From option (c), $\frac{94}{4} = 23.5$ is not divisible by 4.

Hence (c) 56783294 is not divisible by 4.

12. The largest 5 digit number that is exactly divisible by 88 is:

(a) 99968 (b) 99984
(c) 99990 (d) 99978

SSC CGL (Tier-I) 17/07/2023 (Shift-II)

Ans. (a) : If a number is divisible by 88, then it will be divisible by both 11 and 8.

<u>Rule of divisibility by 11:-</u> If the difference between the sum of the digits at even places and the sum of the digits at odd places of the number is '0' or divisible by '11' then that number is also divisible by 11.

<u>Rule of divisibility by 8:-</u> If the number made from the last three digits of the given number is divisible by 8 then that number is also divisible by 8.

From option (a)

Number → 99968

Divisibility by 11

$= (9+9+8) - (9+6) = 26-15$

$= 11$ (R = 0)

Divisibility by 8.

$99968 \rightarrow \frac{968}{8} = 121$

R= 0

Hence, the largest 5 digit number 99968 is divisible by 88.

13. Mohan divides 18935 by a certain number. If he gets quotient and remainder as 102 and 65 respectively, then the divisor is ____?

(a) 165 (b) 155
(c) 185 (d) 175

SSC Selection Posts XI-27/06/2023 (Shift-III)

Ans. (c) : Dividend = Divisor × Quotient + Remainder

$\Rightarrow 18935 = \text{Divisor} \times 102 + 65$

$\Rightarrow 18870 = \text{Divisor} \times 102$

$\Rightarrow 9435 = \text{Divisor} \times 51$

$\Rightarrow \text{Divisor} = 185$

14. What is the least number that should be added to 700, so that the number becomes the multiple of 17?

(a) 3 (b) 12 (c) 14 (d) 9

SSC MTS 04/05/2023 (Shift I[st])

Ans : (c)

17)700(41
68
 20
 17
  3

Now, 17–3 = 14

Hence, 14 should be added to 700 so that it becomes the it multiple of 17.

15. **Which number among 11368, 11638, 11863 and 12638 is divisible by 11?**
(a) 11863 (b) 11368
(c) 12638 (d) 11638

SSC CGL (Tier-I) 27/07/2023 (Shift-III)

Ans. (d) : **Rule of divisibility by 11:-** The difference between sum of digits at even places and sum of digits at odd Places of the number is '0' or divisible by 11 then that number is also divisible by 11.
From option (d),
$11638 = (1 + 6 + 8) – (1 + 3)$
$= 15 – 4 = 11$
So, the number 11638 is divisible by 11.

16. **Find the least value of (*) in the number 3*740 such that it is divisible by 12.**
(a) 2 (b) 4 (c) 0 (d) 1

SSC CHSL (Tier-I) 11/08/2023 (Shift-I)

Ans. (d) : For the divisibility of 12 the number 3*740 should be divisible by both 3 and 4.
Divisibility Rule of 3:- If sum of the digits of number is divisible by 3 then the number is also divisible by 3.
Divisibility Rule of 4 :- If the last two digits of the number is divisible by 4 then that number is also divisible by 4.
3*740, then 3 + * + 7 + 4 + 0 = 14 + *
On putting * = 1
14 + 1 = 15 (Divisible by 3)
$3 * 740, \rightarrow \frac{40}{4} \Rightarrow R = 0$ (Divisible by 4)
Hence the least value of $\boxed{* = 1}$

17. **If the seven digit number 965x + 475, is divisible by 9, what will be the value of x ?**
(a) 0 (b) 2 (c) 6 (d) 3

SSC Selection Posts XI-28/06/2023 (Shift-III)

Ans. (a) : Given that:-
Seven digit number = 965x + 475 is divisible by 9
So, 9+6+5+x+4+7+5 = 36+x
at x = 0 → 36+0 → 36 is divisible by 9.
Hence, it is clear that the seven digit number is divisible by 9 if the value of x is taken as 0.

18. **Find the largest two digit number which is divisible by both 7 and 3.**
(a) 63 (b) 96 (c) 84 (d) 91

SSC MTS 02/05/2023 (Shift I[st])

Ans. (c) : The largest two digit number which is divisible by both 7 and 3= L.C.M of 7 and 3 = 21
And the largest two digit number = 99
∴

21)99(4
84
15

Hence the required number = 99 – 15 = 84.

19. **What is the condition for dividing a number by 3.**
(a) The last two digits of that number is divisible by 3

(a) 50 (b) 10 (c) 30 (d) 3

SSC MTS 14/07/2022 (Shift-II)

Ans. (c) : From the question :-
$150 = 2×3×5×5$
$270 = 2×3×3×3×5$
$180 = 2×2×3×3×5$
Hence, 5×3×2 = 30 is the largest number which divides these numbers completely.

21. **The sum of the two numbers 10373 + 24871 is divisible by which of the following number?**
(a) 7 (b) 8
(c) 6 (d) 13

SSC Selection Posts XI-27/06/2023 (Shift-I)

Ans. (c) :
From option (c) $\Rightarrow \frac{10373+24871}{6} = \frac{35244}{6} = 5874$
R = 0
Hence, the sum of the two numbers (10373+24871) is divisible by 6.

22. **Find the least number which is completely divisible by 9, 24 and 36.**
(a) 72 (b) 24 (c) 36 (d) 9

SSC CGL 07/12/2022 (Shift-II)

Ans. (a): The least number which is completely divisible by 9,24 and 36 will be the least common multiple (LCM) of these numbers:-

2	9,24,36
2	9,12,18
2	9,6,9
3	9,3,9
3	3,1,3
	1,1,1

$= 2×2×2×3×3 = 72$
Hence, 72 is the least number which is completely divisible by 9, 24 and 36.

23. **When 19^{19} + 20 is divided by 18, find the remainder.**
(a) 3 (b) 0 (c) 2 (d) 1

SSC CGL 09/12/2022 (Shift-IV)

Ans. (a) : As per question:-
$$= \frac{19^{19}+20}{18} = \frac{(1+18)^{19}+18+2}{18} = \frac{3}{18} \quad \boxed{R = 3}$$
Hence, required reminder = 3

@apna_pdf

24. A six-digit number formed by repeating a three-digit number is always divisible by?
(a) 1001 (b) 111 (c) 19 (d) 101
SSC CGL 12/12/2022 (Shift-II)

Ans. (a): When a six-digit number is formed by repeating a 3-digit number, like ABC is written ABC ABC then it is always divisible by 7, 11, 13 and LCM of 7, 11, 13 is 1001.

25. If the nine-digit number 3422213AB, is divisible by 99, then what is the value of 2A+B ?
(a) 10 (b) 11 (c) 13 (d) 12
SSC CGL 13/12/2022 (Shift-IV)

Ans. (b) :
$\because$ 3422213AB is divisible by 99
$99 = 9 \times 11$
On putting A = 1 and B = 9,
$\Rightarrow \frac{3+4+2+2+2+1+3+1+9}{9} = \frac{27}{9}$ $\boxed{R = 0}$
and
$\rightarrow (3+2+2+3+9)-(4+2+1+1)$
$\rightarrow 19-8$
$\rightarrow 11$ $\boxed{R = 0}$
Hence If we take A = 1 and B = 9, the number is divisible by 99.
Then $2A + B = 2\times1+9 = 11$

26. Find the greatest number 23a68b, Which is divisible by 3 but NOT divisible by 9.
(a) 238689 (b) 237687
(c) 239685 (d) 239688
SSC CGL 11/04/2022 (Shift-I)

Ans. (c) :
<u>Divisibility Rule of 3:-</u> If the sum of the digits of the number is divisible by 3 then that number is also divisible by 3.
Divisibility rule of 9:- If the sum of the digits of number is divisible by 9 then that number is also divisible by 9.
From option (c) :- number :- 239685
$\Rightarrow \frac{2+3+9+6+8+5}{3} = \frac{33}{3} = 11$ $\boxed{R = 0}$
So number is divisible by 3.
$\frac{2+3+9+6+8+5}{9} = \frac{33}{9}$ R = 6
Number is not divisible by 9.
Hence, number 239685 is divisible by 3 but not by 9.

27. If the 7 digit number x8942y4 is divisible by 56, then what is the value of (x^2+y) for the largest value of y, Where x and y are natural numbers?
(a) 44 (b) 70
(c) 33 (d) 55
SSC CGL 11/04/2022 (Shift-III)

Ans. (d) : x8942y4, is divisible by 56, so that number will be also divisible by 7 and 8.
<u>Divisibility Rule of 8:-</u> If the number made from the last three digits of the given number is divisible by 8 then that number is also divisible by 8.
<u>Divisibility rule of 7 :-</u> The difference between twice the unit digit of the given number and the remaining part of the given number should be a multiple of 7 or it should be equal to '0'.
Given number is x8942y4
On putting y = 6
$\frac{264}{8} = 33$ (R = 0)
On putting x = 7
$\frac{789426-4\times2}{7} = \frac{789418}{7} \Rightarrow R = 0$
So, x = 7, y = 6
Then
$x^2 + y = (7)^2 + 6 = 49 + 6 = 55$

28. If 8A5146B, is divisible by 88, then what is the value of (B–A) ?
(a) 0 (b) 2
(c) –1 (d) 1
SSC CGL 12/04/2022 (Shift-II)

Ans. (d) : 8A5146B, is divisible by 88 then that number will be also divisible by both 11 and 8.
<u>Divisibility rule of 8:-</u> If the number made by last three digits of the given number is divisible by 8 then that number is also divisible by 8.
$\frac{46B}{8}$
A $\boxed{B = 4}$
$\frac{464}{8} = 58 \Rightarrow$ $\boxed{R = 0}$
<u>Divisibility Rule of 11:-</u> The difference between the sum of digits at even places and sum of digit at odd places is either '0' or divisible by 11 then that number is also divisible by 11.
8A51464
At A = 3
(8+5+4+4) – (3+1+6)
$= \frac{21-10}{11} = \frac{11}{11} = 1$
(R = 0)
Hence, A = 3 and B = 4
So, B–A = 4–3= 1

29. If a 10 digit number 54726x79y6, is divisible by 72, then what is the value of 5x – 3y, for the least value of y?
(a) 16 (b) 19 (c) 17 (d) 23
SSC CGL 21/04/2022 (Shift-III)

Ans. (a) : Number = 54726x79y6
Divisor = 72 = 8 × 9
<u>Divisibility rule of 8:–</u> If the number made by last three digits of the given number is divisible by 8 then that number is also divisible by 8.
$\frac{9y6}{8}$
on putting y = 3 (least value)
$\frac{936}{8} \Rightarrow R = 0$

@apna_pdf

Now,

The divisibility Rule of 9 :- If the sum of the digits of given number is divisible by 9 then that number is also divisible by 9.

54726x7936

= 5 + 4 + 7 + 2 + 6 +x + 7 + 9 + 3 + 6

= 49 + x,

At x = 5

$49 + 5 = \frac{54}{9} \Rightarrow R = 0$

So, x = 5 and y = 3

Then 5x–3y = 5×5 –3×3 = 25–9 = 16

30. If a nine digit number 485x3678y, is divisible by 72, for the least value of x find the value of (2y–3x).

(a) 8 (b) 6 (c) 11 (d) 9

SSC CGL 21/04/2022 (Shift-II)

Ans. (a) : number = 485x3678y,

Divisibility = 72 = 8 × 9

Divisibility rule of 8:- If the number made from the last three digits of the given number is divisible by 8, then the number will be divisible by 8.

$485x3678y \rightarrow \frac{78y}{8}$ at $\boxed{y = 4} \rightarrow \frac{784}{8} \Rightarrow R = 0$

Divisibility rule of 9:- If the sum of the digits of the given number is divisible by 9, then the number is divisible by 9.

485x36784

= 4 + 8 + 5 + x + 3 + 6 + 7 + 8 + 4

= 45 + x

x = 0 (At least value) = $\frac{45}{9} \Rightarrow R = 0$

Hence, x= 0 , y = 4

Then (2y –3x) = 2×4–3×0= 8

31. Find the value of k in the number 3426k, if the number is divisible by 6 but NOT divisible by 5.

(a) 4 (b) 9 (c) 6 (d) 3

SSC MTS 01/09/2023 (Shift Ist)

Ans. (c) : Number = 3426k

Divisibility Rule of 5:- If the unit digit of any number is 0 or 5, then the number will be divisible by 5.

Divisibility Rule of 6:- The number which is divisible by 2 and 3 both, will be is divisible by 6.

Divisibility rule of 3:- If the sum of the digits of the number is divisible by 3 then the number is divisible by 3.

Divisibility rule of 2:- If the last digit of the number is given either '0' or an even number, then the number is divisible by 2.

at k= 4 , 3426k = 34264

= 3+4+2+6+4 = 19 which is not divisible by 3

at k= 6 → 3426k = 34266

$= 3+4+2+6+6 = \frac{21}{3}$, R = 0

Hence at k=6 the number is divisible by 6 but not by 5.

32. If 8A5146B, is divisible by 88, what will be the value of A^B ?

(a) 27 (b) 64 (c) 12 (d) 81

Ans. (d) : 8A5146B, is divisible by 88 →8×11

Divisibility rule of 8:- If the number made from the last three digits of the number is divisible by 8 then the number is divisible by 8.

$8A5146B \rightarrow \frac{46B}{8}$, at $\Rightarrow \boxed{B = 4} \frac{464}{8} \Rightarrow R = 0$

Divisibility rule of 11:- If difference between the sum of the digits at even places and sum of digit at odd places is '0' or divisible by 11 then that number is divisible by 11.

8A51464 → (8+5+4+4) –(A+1+6) = 14–A

at A = 3

= 14–3 = 11

Number is divisible by 11

∴ A = 3 and B= 4

Then $A^B = (3)^4 = 3×3×3×3= 81$

33. Find the largest number 234a5b, which is divisible by 22, but not by 5.

(a) 234751 (b) 234652
(c) 234058 (d) 234850

SSC CGL 18/04/2022 (Shift-I)

Ans. (b) : The number 234a5b is divisible by 22

22 → 2×11

Divisibility rule of 2:- If the last digit of the given number is either '0' or an even number then that number will be completely divisible by 2.

Note :- The last digit should not be '0' because the number is not divisible by 5.

Divisibility rule of 11:- If the difference between the sum of the digit at even places of the number and sum of the digit at odd places of the number is either '0' or divisible by 11 then that number is also divisible by 11.

Number → 234a5b

On putting $\boxed{b = 2}$

The number will be divisible by 2

for the divisibility of 11

(2+4+5) – (2+a+3) = 11–5–a = 6–a

on putting a = 6

then = 6–6 = 0

So the number is '234652'

34. Which of the following number is divisible by 55?

(a) 185625 (b) 171125
(c) 164485 (d) 178765

SSC CHSL –06/06/2022 (Shift-III)

Ans. (a) : 55 = 5 × 11

If a number is divisible by 55 then that number will be divisible by both 5 and 11.

Divisibility rule of 5:- If the last digit of the number is '0' or 5, then number will be divisible by 5.

Divisibility rule of 11:- If the difference between the sum of the digits of number at even places and the sum of digits of the number at odd places is '0' or divisible by 11, then that number is divisible by 11.

@apne_pdf

From option (a)
185625 − last digit is 5, so it is divisible by 5. The difference of the sum of the alternate digits:-
= (1 + 5 + 2) ~ (8 + 6 + 5)
= 8 ~ 19 = 11, divisible by 11
The number is divisible by both 5 and 11, so the number is divisible by 55.

(a) 2595 (b) 3465
(c) 2995 (d) 3195
SSC CHSL –10/06/2022 (Shift-I)

Ans. (c) : 15 = 3 × 5
If a number is divisible by 15 then the number is also divisible by both 3 and 5
Divisibility rule of 3:- Sum of the digits of the number must be divisible by 3.
Divisibility rule of 5:- last digit of the number must be '0' or 5.
From option (c) ,
2995 → 2 + 9 + 9 + 5 = 25
It is clear that the last digit of the number is 5 but the sum of the digits of the number is not divisible by 3, so the number is not divisible by 15.

(a) 2 (b) 1 (c) 8 (d) 0
SSC CHSL –08/06/2022 (Shift-II)

Ans. (c): Divisibility rule of 11:- If the difference between sum of the digits at the even places and sum of digits at the odd places is '0' or divisible by 11, then number is also divisible by 11.
From option (c), on putting * = 8
6347825
= (6+4+8+5) −(3+7+2) = 23–12= 11
Hence, to make the number completely divisible by 11, * should be kept as 8.

37. Which of the following number is not divisible by 36?
(a) 259884 (b) 136216
(c) 120816 (d) 124344
SSC CHSL –03/06/2022 (Shift-II)

Ans. (b) : 36 = 4 × 9
If a number is divisible by 36 then it will be also divisible by both 4 and 9.
Divisibility rule of 4:- If the number made from the last two digits is divisible by 4 then the number is also divisible by 4.
Divisibility rule of 9:- If the sum of the digits of the number is divisible by 9, then the number is also divisible by 9.
From option (b), 136216
$\frac{16}{4} = 4$ and 1+3+6+2+1+6= $\frac{19}{9}$ is not divisible by 9.
So, Option (b), 136216 is the number which is not divisible by 36.

(a) 2 (b) 3
(c) 0 (d) 1
SSC CHSL –31/05/2022 (Shift-II)

Ans. (d) : ∵ 732xy is divisible by 70
∴ It will be divisible by both 10 & 7.
The Given number = 732xy
For the divisibility of 10
Last digit should be 0.
∴ Y = 0
For the divisibility of 7
$\frac{732X-0\times 2}{7}$ (∵ Y = 0)
$=\frac{732X}{7}$
At X = 2, $\frac{7322}{7}$ R = 0
∴x = 2, y = 0
So,
$\Rightarrow \frac{X+Y}{2}=\frac{2+0}{2}=1$

(c) 100000 (d) 999960
SSC CHSL –27/05/2022 (Shift-II)

Ans. (d) : The largest six digit number = 999999
If we divide 99999 by 52 we get

and
Remainder = 39
So the required number
= 999999 − 39
= 999960
Hence 999960 is the largest six digit number divisible by 52.

SSC MTS 02/05/2023 (Shift Ist)

```
336)9999(29

So the largest 4 digit number which is divisible by 16, 21, 24 and 25 each i.e. x = 9999–255

Ans. (b) : ∵ 89563x87y, is divisible by 72.

∴ It will be divisible by both 8 and 9.

<u>Divisibility rule of 8:-</u> Number made by the Last three digits of a given number must be divisible by 8.

87y, For the divisibility of 8, $\boxed{y = 2}$

<u>Divisibility rule of 9:–</u> The sum of the digits of the number must be divisible by 9.

8 + 9 + 5 + 6 + 3 + x + 8 + 7 + 2

Number greater than 48 which is divisible by 9 = 54

∴ 48 + x = 54
x = 54 – 48
x = 6

Now, x = 6, y = 2

So, $\sqrt{7x-3y} = \sqrt{7\times6-3\times2}$

203, 210, 217 798
$$n = \frac{798 - 203}{7} + 1 = 86$$
Number divisible by 35 between 200 to 800
210, 245, 280 770
$$n = \frac{770 - 210}{35} + 1 = 17$$

(c) 8765001 (d) 8703541
SSC CHSL –15/10/2020 (Shift-III)

Ans. (c) :
Rule of divisibility by 3– If the sum of the all digits of the given number is exactly divisible by 3 then that number will be divisible by 3

(a) 36 (b) 64
(c) 32 (d) 20
SSC CGL (Tier-I) 13/04/2022 (Shift-III)

Ans : (b) The given number 9m2365n48 is divisible by 88. We can write 88 as 8 × 11.
By the divisibility rule of 8, we have n48 is divisible by 8.
For n = 2 (smallest value of n), we get the resultant number divisible by 8.
And for n = 2, we will check the divisibility of 11.
$\Rightarrow (9 + 2 + 6 + 2 + 8) - (m + 3 + 5 + 4)$
$\Rightarrow 27 - (m - 12)$
$\Rightarrow 15 - m$
For m = 4, we get the resultant number divisible by 11.
$\therefore$ The value of $(m^2 \times n^2) = 4^2 \times 2^2$
$= 16 \times 4$
$= 64$

64. **If 8A5146B is divisible by 88, then what is the value of AB?**
(a) 15 (b) 12
(c) 9 (d) 20
SSC CGL (Tier-I) 13/04/2022 (Shift-II)

Ans : (b) The given number 8A5146B is divisible by 88, so it must be perfectly divisible by both 8 and 11.
By the divisibility rule of 8, we have 46B is divisible by 8.
For B = 4, we get the resultant number divisible by 8.
And for B = 4, we will check the divisibility of 11.
$=(8 + 5 + 4 + 4) - (A + 1 + 6)$
$=21 - A - 7$
$=14 - A$
For A = 3, we get the resultant number divisible by 11.
$\therefore$ The value of AB = 3 × 4 = 12

(a) 27 (b) 64
(c) 81 (d) 12
SSC CGL (Tier-I) 19/04/2022 (Shift-II)

Ans. (c) The given number 8A5146B is divisible by 88.
So the number must be divisible by 8 and 11.
By the divisibility rule of 8, we have 46B is divisible by 8.
For B = 4, we get the resultant number divisible by 8.
And for B = 4, we will check the divisibility of 11

$\Rightarrow(8 + 5 + 4 + 4) – (A + 1 + 6)$
$\Rightarrow 21 – A – 7$
$\Rightarrow 14 – A$
For A = 3, we get the resultant number divisible by 11.
$\therefore$ The value of $A^B = 3^4 = 81$

66. If a nine digit number 468x5138y is divisible by 72, then the value of $\sqrt{4x+3y}$ is:
(a) 8 (b) 9
(c) 12 (d) 6
SSC CGL (Tier-I) 18/04/2022 (Shift-II)

Ans. (d) Since the number 468x5138y is divisible by 72 then it must be divisible by both 8 and 9.
If any number is perfectly divisible by 8, then last three digits should be divisible by 8.
$\therefore$ For y = 4, 384 is divisible by 8.
Again, if any number is perfectly divisible by 9 then the sum of its digits must be divisible by 9.
$\Rightarrow 4 + 6 + 8 + x + 5 + 1 + 3 + 8 + 4$
$\Rightarrow 39 + x$
$\Rightarrow x = 6$ [$\because$ 45 is divisible by 9]
Now, $\sqrt{4x+3y}$
$\Rightarrow \sqrt{4\times6+3\times4}$
$\Rightarrow \sqrt{36}$
$\Rightarrow 6$

(c) 234652 (d) 374151
SSC CGL (Tier-I) 18/04/2022 (Shift-I)

Ans. (c) $\frac{234a5b}{22} = \frac{234a5b}{2\times11}$
Divisibility rule of 2 $\rightarrow$A number whose unit digit is 0 or even number
$\therefore \frac{5b}{2} = \frac{52}{2} = 21$
$\therefore b = 2$
Divisibility rule of 11 $\rightarrow$ The difference between the sum of the digits at even and sum of digits at odd places should be zero or multiple of 11.
$\therefore (2 + 4 + 5) – (3 + a + b) = 0$
$\Rightarrow 11– 5 – a = 0$
$\Rightarrow 6 – a = 0$
$\therefore a = 6$
Hence, the greatest number = 234652

(a) 490 (b) 289
(c) 192 (d) 298
SSC CGL (Tier-I) 13/04/2022 (Shift-I)

Ans. (d) The given number 7x79251y8 is divisible by 36
Divisibility rule of 4- A number is divisible by 4 if its last two digits are divisible by 4.
Divisibility rule of 9 - A number is divisible by 9 if sum of all its digits are divisible by 9
The number 7x79251y8 is divisible by 4 if y8 is divisible by 4,
if y = 0, 4 or 8
For maximum value of y,
y = 8
7x7925188 is divisible by 9 if, sum of its digits must be divisible by 9.
$\Rightarrow 7 + x + 7 + 9 + 2 + 5 + 1 + 8 + 8$
$\Rightarrow 47 + x$
For x = 7, we get the resultant number divisible by 9
$\therefore$ The value of $(10x^2 – 3y^2)$
$= 10 (7)^2 – 3 (8)^2$
$= 490 – 192$
$= 298$

Ans.(b) **Divisibility rule of 8 :-** If the last 3 digits of number are divisible by 8 then the number is divisible by 8.
Divisibility rule of 11:- If difference between sum of even place value and odd place value is multiple of 11 or 0 then the number is divisible by 11.
$8A5146B \rightarrow \frac{46B}{8} \rightarrow \boxed{B = 4}$
$\Rightarrow 8A51464$
And, $(8 +5 + 4 + 4) – (A + 1 + 6) = 11$
$\Rightarrow 21 – A –7 = 11$
$\Rightarrow 21 – 7 – 11 = A$
$\Rightarrow 21 – 18 = A$
$\therefore \boxed{A = 3}$
$\therefore$ Value of $B^A = 4^3 = 64$
Hence, option (b) is correct.

(a) 23 (b) 24
(c) 16 (d) 17
SSC CHSL 05/08/2021 (Shift-I)

Ans. (d) : 672 xy is divisible by 3, 7 and 11.
$\therefore \frac{6+7+2+x+y}{3} = \frac{15+(x+y)}{3}$
x + y = 3, 6
x + y = 3 ....(i)
$\frac{(6+2+y)-(7+x)}{11} = 0$
8 + y – 7 – x = 0
x – y = 1 ....(ii)

(a) 81 (b) 9
(c) 0 (d) 72
SSC CGL–(Tier-I) 16/08/2021 (Shift II)

When we divide 68899 by 231, we get 61 as a remainer.
Now, required number
688xy = [68899–61]
688xy = 68838
x=3 and y = 8
The value of (5x+3y)

= 100011
Hence, option (b) is correct.

92. If the 11 digit number 4y6884805x6 is divisible by 72, and x ≠ y, then the value of $\sqrt{xy}$ is:
(a) $\sqrt{8}$ (b) $\sqrt{12}$
(c) $\sqrt{6}$ (d) $\sqrt{5}$
SSC CHSL 10/08/2021 (Shift-III)

Ans. (c) : The given 11–digit number 4y6884805x6 is divisible by 72 i.e. also divisible by both 8 and 9.

$\frac{5x6}{8} \Rightarrow \boxed{x = 3}$
By divisibility rule of 9,
4y688480536
$\frac{4+y+6+8+8+4+8+0+5+3+6}{9}$
$\Rightarrow \frac{52+y}{9}$ $[\because x \neq y]$
$\Rightarrow \frac{52+2}{9}$
$\Rightarrow \frac{54}{9}$
$\Rightarrow \boxed{y = 2}$
So, $\sqrt{xy} = \sqrt{3\times 2} = \sqrt{6}$

93. If an eleven-digit number 6578x43267y is divisible by 72, then the value of $\sqrt{x+6y}$ will be:
(a) 4 (b) 5
(c) 3 (d) 6
SSC CHSL 16/04/2021 (Shift-III)

Ans.(a) : The given 11-digit number 6578x43267y is divisible by 72 it means that it is also divisible by both 8 and 9.
$\therefore$ By divisibility rule of 8,
$\frac{67y}{8} \Rightarrow \boxed{y = 2}$
By divisibility rule of 9,
6578x432672
$\frac{6+5+7+8+x+4+3+2+6+7+2}{9}$
$\Rightarrow \frac{50+x}{9}$
For, x = 4, 54 is divisible by 9
$\Rightarrow \boxed{x = 4}$
So, $\sqrt{x+6y} = \sqrt{4+6\times 2} = \sqrt{4+12} = \sqrt{16} = 4$
Hence, option (a) is correct.

94. If a nine-digit number 1263487xy is divisible by both 8 and 5, then the greatest possible values of x and y, respectively are:
(a) 6 and 0 (b) 2 and 5
(c) 6 and 5 (d) 2 and 0

@apna_pdf

$\Rightarrow \frac{49+x}{9}$

[For x = 5, 54 is divisible by 9]

$\Rightarrow \boxed{x=5}$

So, $\sqrt{8x+6y} = \sqrt{8\times5+6\times4} = \sqrt{40+24} = \sqrt{64} = 8$

Hence, option (a) is correct.

96. If the nine-digit number 48x4923y8 is divisible by 88, then the value of (6x+5y) for the maximum value of y, will be:

(a) 72 (b) 76
(c) 65 (d) 71

SSC CHSL 19/08/2021 (Shift-II)

Ans. (a) : The given 9-digit number 48x4923y8 is divisible by 88 i.e. also divisible by both 8 and 11.

$\therefore$ By divisibility rule of 8,

$\frac{3y8}{8} \Rightarrow \boxed{y=6}$ (Maximum value)

By divisibility rule of 11,

(4 + x + 9 +3 + 8)–(8 + 4+ 2+ 6) = 0 or 11

$\Rightarrow$ 24 +x – 20 = 0 or 11

$\Rightarrow$ x + 4 = 0 or 11

$\Rightarrow$ x + 4 = 11

$\therefore \boxed{x=7}$

So, (6x + 5y) = (6 × 7 + 5 × 6) = (42 +30) = 72

Hence, option (a) is correct.

97. The largest six-digit number exactly divisible by 243 is:

(a) 999949 (b) 999947
(c) 999945 (d) 999943

SSC CHSL 11/08/2021 (Shift-III)

(c) A = 2, B = 3 (d) A = 3, B = 2

SSC CHSL 09/08/2021 (Shift-II)

Ans. (d) : The given number 645A2879B8 is divisible by both 8 and 9.

$\therefore$ By divisibility rule of 8,

$\frac{9B8}{8} \Rightarrow \boxed{B=2}$ (Smallest value)

By divisibility rule of 9,

645A287928

$\frac{6+4+5+A+2+8+7+9+2+8}{9}$

$\Rightarrow \frac{51+A}{9}$

For A = 3, 54 is divisible by 9

$\Rightarrow \boxed{A=3}$ (Smallest value)

Hence, option (d) is correct.

99. If the nine-digit number 259876p05 is completely divisible by 11, then what is the value of (p^2+5)?

(a) 54 (b) 45
(c) 50 (d) 48

SSC CHSL 12/08/2021 (Shift-II)

Ans. (a) : By divisibility rule of 11,

(2 +9 +7 +p + 5) – (5 + 8 +6 + 0)=Multiple of 11 or 0

$\Rightarrow$ 23 + p – 19 = Multiple of 11 or 0

$\Rightarrow$ p + 4 = 11

$\therefore$ p = 11 – 4 = 7

So, $(p^2 + 5) = (7^2 + 5) = (49 + 5) = 54$

Hence, option (a) is correct.

(a) 3 (b) 14
(c) –8 (d) 0

Ans : (c) By divisibility rule of 11,

(A + 2 + 7 + 6 + 4) – (9 + 5 + B + 8) = 0 or 11 or – 11

$\Rightarrow$ A + 19 – 22 – B = 0 or 11 or – 11

$\Rightarrow$ A – B – 3 = –11 (For the least value)

$\therefore$ A – B = – 11 + 3 = –8

So, the least value of (A – B) is – 8.

Hence, option (c) is correct.

(a) A = 5, B = 3 (b) A = 4, B = 8
(c) A = 4, B = 6 (d) A = 3, B = 9

SSC CHSL 12/08/2021 (Shift-III)

Ans. (b) : The given 9-digit number 8475639AB is divisible by 99 i.e. also divisible by both 9 and 11.

$\therefore$ By divisibility rule of 9,

8 + 4 + 7 + 5 + 6 + 3 + 9 + A + B

= 42 + A + B

So, A + B can be 3 or 12.

Now, From options only option (b) and (d) satisfying as A + B = 12

From option (d)–

(8 + 7+ 6 + 9 + 9) – (4 + 5 + 3 + 3)

= 39 – 15

= 24 (24 is not multiple of 11)

$\therefore$ From option (b)–

(8 +7 +6 +9 +8) – (4 + 5 + 3 + 4)

= 38 – 16

= 22 (22 is multiple of 11)

So, required answer will be option (b).

(c) A=6, B=3 (d) A=6, B=2

SSC Sel. Post Phase VIII (G.L.) 09.11.20 (Shift-II)

Rule of divisibility for 9 – For any number to be divisible by 9, the sum of digits of that number should be divisible by 9

$$=\frac{5+6+5+6+x+5+2}{9}=\frac{29+x}{9}$$

On taking x = 7 the number will be divisible by 9

Rule of divisibility for 8 – For any number to be divisible by 8 the last three digits of a number should be divisible by 8

$$\Rightarrow \frac{x52}{8}$$

Hence on taking $x = 7 = \frac{752}{8} = 94$

Hence required value of x will be 7

(a) 6 (b) 8 (c) 4 (d) 2

SSC CGL (TIER-I)-2018 – 12.06.2019 (Shift-II)

Ans. (b) : ∵ Numebr 6913x08 is divisible by 88

Hence, The given number should be also divisible by 11 and 8

To be divisible by 8 – the last three digits of The given number must be divisible by

$$\Rightarrow \frac{x08}{8} \text{ (on putting x = 8)}$$

To be divisible by 11,

$$\frac{(6+1+x+8)\square(9+3+0)}{11}=\frac{(15+x)\square 12}{11}$$

$$=\frac{3+x}{11} \quad (\because \text{ on taking x = 8})$$

In both situations x = 8

121. What is the value of x so that the seven digit number 8439x53 is divisible by 99?

(a) 6 (b) 3 (c) 4 (d) 9

SSC CGL (TIER-I)-2018 – 13.06.2019 (Shift-II)

Ans. (c) : If the number 8439x53 is divisible by 99 then it is also divisible by 9 and 11.

∴**Rule of divisibility by 9,**

Sum of digits of number will be divisible by 9

$$=\frac{8+4+3+9+x+5+3}{9}$$

$$=\frac{32+x}{9}$$

On putting x = 4,

Rule of divisibility by 9:–For any number to be divisible by 9 the sum of all digits of given number will divisible by 9.

$$\Rightarrow \frac{5+5+3+5+0+x+2}{9}$$

On taking x = 7 the number will be divisible by 9.

Rule of divisibility by 8:–For any number to be divisible by 8, the last three digits of given number should be divisible by 8.

Which means, $\frac{0x2}{8}$

Hence on taking $x = 7 \Rightarrow \frac{072}{8} = 9$

Hence the value of x = 7

Ans. (b) : If the number 7220x558y2 is divisible by 88 then that number will be surely divisible by factor of 88

Factors of 88 = 8 × 11

Rule of divisibility for 8–The last three digits of the given number is completely divisible by 8 then that number will be divisible by 8

∴ y = 3

Rule of divisibility for 11–if the difference between the sum of digits of even places and sum of digits of odd places in the given number is zero or multiple of 11 then that number is completely divisible by 11.

∴ x = 0

Hence, 5x + 5y = 5 × 0 + 5 × 3 = 15

154. If an 8-digit number 30x558y2 is divisible by 88, then the value of (6x+6y) is:

(a) 30 (b) 66
(c) 35 (d) 42

SSC CHSL 08/07/2019 (Shift-I)

Ans. (d) : 30x558y2 is divisible by 88

∴ 30x558y2 is divisible by both 8 and 11

To be divisible by 8,

y = 3, 7

To be divisible by 11,

On putting y = 3

$$\frac{(3 + x + 5 + y) - (0 + 5 + 8 + 2)}{11} = \text{multiple of 0 or 11}$$

$$= \frac{(8 + x + 3) - 15}{11} = \text{multiple of 0 or 11}$$

$$= \frac{x + 3 - 7}{11} = \text{multiple of 0 or 11}$$

Hence, x = 4

∴ 6x + 6y = 24 + 18 = 42

155. If the seven digit number 64x29y6 (x > y) is divisible by 72, what is the value of (2x - 3y)?

(a) 3 (b) 7
(c) 13 (d) 9

SSC CHSL 09/07/2019 (Shift-I)

Ans. (a) : 64x29y6 (x > y)

If the last three digits of a given number is divisible by 8 then that number will be divisible by 8.

Hence, y = 3

It the sum of digits of a given number is divisible by 9 then that number is divisible by 9

$$\frac{6 + 4 + x + 2 + 9 + 3 + 6}{9}$$

$$\Rightarrow \frac{30 + x}{9} \ (x = 6)$$

$\Rightarrow$ $(2x - 3y) \Rightarrow 2 \times 6 - 3 \times 3 = 3$

156. If the seven digit number 64x29y6 (x > y) is divisible by 72, what is the value of (2x - y)?

(a) 13 (b) 3 (c) 9 (d) 7

SSC CHSL 09/07/2019 (Shift-II)

Ans. (c) : If the number 64x29y6 is divisible by 72 then it is divisible by factors of 72 which means it is divisible by both 8 and 9

To be divisible by 8, the last three digits of given number must be divisible by 8. Hence on putting y = 3 the last three digit (936) will be obtained which is divisible by 8.

Similarly, for any number to be divisible by 9, the sum of all the digits must be divisible by 9

6 + 4 + x + 2 + 9 + 3 + 6

= 30 + x

on putting x = 6, number will be divisible by 9

∴ 2 x – y = 2 × 6 – 3 = 9

157. The 10 digit number 2x600000y8 is exactly divisible 24. If x ≠ 0 and y ≠ 0, then the least value of (x+y) is

(a) 2 (b) 5
(c) 8 (d) 9

SSC CHSL 11/07/2019 (Shift-I)

Ans. (b) : 2x600000y8 is divisible by 24

∴ 2x600000y8 is divisible by both 3 and 8

To be divisible by 8, y = 4 (for minimum value and y ≠ 0)

To be divisible by 3,

$$\frac{2 + x + 6 + y + 8}{3} = \frac{20 + x}{3} \qquad (y = 4)$$

For minimum value x = 1

Hence, x + y = 1 + 4 = 5

(a) 346217 (b) 594327
(c) 897342 (d) 734895

SSC CHSL –17/03/2020 (Shift-III)

Ans. (d) : From option (d),

If the sum of all digits of a given number is divisible by 9 then given number is divisible by 9

Hence, 734895 is divisible by 9

159. If 'a' is a natural number, then ($7a^2$ + 7a) is always divisible by:

(a) only 7 (b) Both 7 and 14
(c) only 17 (d) only 21

SSC CHSL –16/10/2020 (Shift-I)

@apna_pdf

Ans. (b) : ∵ a is a natural number

∴ On taking a = 1, $7a^2 + 7a = 7+7 = 14$

On taking a = 2, $7a^2 + 7a = 7×4 + 7×2 = 28 + 14 = 42$

On taking a = 3, $7a^2 + 7a = 7×9 + 7×3 = 63+21 = 84$

∴ 14, 42, 84 all numbers are divisible by both 7 and 14

Hence $(7a^2 + 7a)$ will always be divisible by both 7 and 14

(a) n + 105 (b) n + 35

(c) n + 110 (d) n + 21

SSC CHSL –16/10/2020 (Shift-III)

Ans. (a) : ∵ Number 'n' is divisible by 3, 5 and 7

∴ Number 3, 5, 7 are factors of n.

Hence the next larger number divisible by these numbers

= n + (L.C.M of 3, 5, 7)

SSC CHSL –15/10/2020 (Shift-I)

Ans. (a) : ∵ To be divisible by 9 the sum of their digits must be divisible by 9

$\therefore \frac{7129p465}{9} = \frac{34+p}{9}$

On putting p = 2

$\frac{34+p}{9} = \frac{34+2}{9} = \frac{36}{9} = 4$

Hence, p = 2

162. Given that $2^{20}+1$ is completely divisible by a whole number, which of the following is completely divisible by the same number?

(c) $2^{90} + 1$ (d) $2^{60} + 1$

SSC CHSL –16/10/2020 (Shift-II)

$$= \frac{\left(2^{20}+1\right)\left(2^{40}-2^{20}+1\right)}{\left(2^{20}+1\right)}$$

Hence, $2^{60} + 1$ will be exactly divisible by the same number as $2^{20} + 1$

1+9+5+9+6 = 30

30 → 30 – 3 = 27(which is divisible by 9)

30 → 30 + 6 = 36(which is divisible by 9)

Hence, required number 19596 – 3 = 19593

$\Rightarrow (2 + 8 + P) - (7 + 5 + 3)$

$\Rightarrow (10 + P) - (15)$

$\Rightarrow P - 5$...........(i)

∵ On putting P = 5, the number is divisible by 11.

Hence value of P = 5

188. Which of the following number is divisible by 6.

(a) 23562 (b) 43742

(c) 53422 (d) 44444

SSC MTS 11-10-2017 (Shift-III)

Ans. (a) : 6 is only divisible by that number which is divisible by both 2 and 3.

From option (a),

The number 23562 exactly divisible by 2 and 3.

Hence, it is also divisible by 6.

189. Which of the following number is not divisible by 4?

(a) 325752 (b) 111184

(c) 222264 (d) 444410

SSC MTS 11-10-2017 (Shift-II)

Ans. (d) : Rule of divisibility by 4– The number formed from the last two digits of the given number is divisible by 4 then that number will also be divisible by 4.

(a) $3257\frac{52}{4} = 13$ (divisible)

(b) $1111\frac{84}{4} = 21$ (divisible)

@apna_pdf

(c) $2222\frac{64}{4}=16$ (divisible)

(d) $4444\frac{10}{4}=$ (not divisible)

Hence, number 444410 is not divisible by 4

190. What is the least number added to 700, so that number becomes multiple of 17?

(a) 3 (b) 12
(c) 14 (d) 9

SSC MTS 11-10-2017 (Shift-I)

Ans : (c) On dividing 700 by 17, we get 3 as a remainder.
Hence on adding (17 – 3) 14 to 700 it will becomes multiple of 17.

191. What least number should be added to 754 so that the number is completely divisible by 59 ?

(a) 21 (b) 13
(c) 16 (d) 7

```
59) 754 (12
    59

    ---
     46
```

On adding 59–46 =13 to 754 the number will be exactly divisible by 59

192. How many of the following number are divisible by 42 ?
2646, 1008, 1470, 656, 2478, 1826

(a) 2 (b) 3
(c) 4 (d) 5

SSC MTS 7-10-2017 (Shift-I)

Ans. (c) : 2646, 1008, 1470, 656, 2478, 1826

Hence there are 4 numbers which are divisible by 42.

193. If A is the smallest three digit number divisible by both 6 and 7 and B is the largest four digit number divisible by both 6 and 7, then what is the value of B – A?

(a) 9912 (b) 9870
(c) 9996 (d) 9954

SSC MTS 08/08/2019 (Shift-III)

Ans. (b) : L.C.M of 6 and 7= 42
A is the smallest three digit number divisible by 42
$\therefore$ A = 42 × 3
$\boxed{A=126}$
Largest 4 digit number divisible by B = 9999 – 3
$\boxed{B=9996}$ $\because \frac{9999}{42}$ remainder = 3
Then, B – A = 9996 –126

194. What is the value of x so that the seven digit number 91876x2 is divisible by 72?

(a) 2 (b) 3
(c) 5 (d) 7

SSC CGL (TIER-I)-2018 – 12.06.2019 (Shift-I)

Ans. (b) : Seven digit number 91876x2 is divisible by 72, so, that number will be divisible by 9 and 8.
Rule of divisible by 9 – If the sum of all the digits of the given number is divisible by 9 then the given number will be also divisible by 9
Number = 91876x2 = (9 + 1 + 8 + 7 + 6 + x + 2)
$=\frac{33+x}{9}$
On putting x = 3, the number will be divisible by 9.
Hence, the value of x = 3
Rule of divisible by 8– Any given number will only be divisible by 8 when the number formed by its hundreds, tens and unit digit is completely divisible by 8
$\therefore$ From option (b) on taking x = 3
The number formed from hundred, tens and unit digits = 632
$\therefore \frac{632}{8}=0$ remainder
Hence, on putting x = 3 the number 9187632 is divisible by 72.

195. Which of the following is divisible by 88?

(a) 4987316 (b) 4987136
(c) 4978136 (d) 4897136

SSC Sel. Post Phase VIII (M.L.) 09.11.20 (Shift-III)

Ans (b) : $\because$ The number, which is divisible by 88 is also divisible by both 8 and 11.
$\because$ from option (b),
$\frac{4987136}{11}$
=(4 + 8 + 1 + 6) – (9 + 7 + 3)
=19 –19 = 0 ($\therefore$ Divisible by 11)
By divisibility rule of 8. ($\therefore$ Divisible by 8)
$\frac{136}{8}=17$
Hence it is clear that number 4987136 is divisible by 8 and 11 so this numbers is divisible by 88.

196. Which of the following is divisible by 11?

(c) 45 (d) 43

SSC CGL (Tier - II) 12-09-19
SSC CPO SI 10/11/2022 (Shift IInd)

Ans. (c) : ∵ We know that

If $N = 2^a \times 3^b \times 5^c \times 7^d$........

Then total number of factors = (a+1) (b+1) (c+1) (d+1).....

∴ $3600 = 2^4 \times 3^2 \times 5^2$

Therefore the number of factors of 3600

Ans. (d) : $N = 3^{14} + 3^{13} - 12$

$= 3^{12}[3^2+3] - 12$
$= 3^{12} \times 12 - 12$
$= 12[3^{12} - 1] = 12[(3^6)^2 - 1^2]$
$= 12[(3^6-1)(3^6+1)] = [12[(729-1)(729+1]$

(a) 5 (b) 7
(c) 9 (d) 6

SSC MTS 11-10-2017 (Shift-III)

Ans. (d) : If y is an integer, then $(y^3 - y)$ will always be multiple of 6

let y is taken as 2−

$= (y^3-y)$
$= (2^3-2) = 6$

It is multiple of 6 hence option (d) is correct

Trick:

The product of n consecutive positive numbers will always be divisible by n.

Ex. 15×16×17×18×19 this number will always be divisible by 5

From the given question,

$(y^3 - y)$
$= y(y^2 - 1) \Rightarrow y(y - 1)(y + 1)$
$= (y - 1)(y)(y + 1)$

This is the product of 3 consecutive numbers which means the number will always be divisible by 3.

3! = 3×2×1 = 6

Similarly the given number will always be a multiple of 6

211. How many multiples of 7 are there from 1 to 100 which are not multiples of 4?

(a) 14 (b) 11

SSC MTS 11-10-2017 (Shift-II)

Ans. (b) : Numbers of multiples of 7 from 1 to 100 $= \frac{100}{7} = 14$

L.C.M of 7 and 4 = 28

Hence from 1 to 100, number divisible by 7 and 4 = $\frac{100}{28}$ =3 number

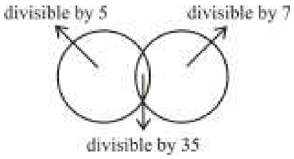
213. How many natural numbers less than 1000 are divisible by 5 or 7 but NOT by 35?
(a) 285 (b) 313
(c) 243 (d) 341
SSC CPO-SI – 11/12/2019 (Shift-I)

Ans. (a)



Total natural numbers below 1000 = 999

Total natural numbers which are divisible by 5= $\frac{999}{5}$ = 199

Total natural numbers which are divisible by 7 = $\frac{999}{7}$ = 142

Total natural numbers which are divisible by 35 = $\frac{999}{35}$ = 28

$\therefore$ Total numbers till 999 which are divisible by 5 and 7 but not divisible by 35= (199 + 142 – 2 × 28) = 285

SSC MTS 08/09/2023 (Shift IInd)
SSC CGL (Tier-II) 11-9-2019

Ans. (c) $\because$ k is an odd number
$\therefore$ k = 1
$8^2 + 5^2 = 64 + 25 = 89$
Hence it is divisible by 89.

Formula:
(i) (a^n+b^n), will always be divisible by (a + b)
Where 'n' is an odd number
(ii) ($a^n–b^n$), will always be divisible by (a–b)
Where 'n' is an odd number
(iii) ($a^n–b^n$), will always be divisible by (a + b) and (a –b)
Where 'n' is an even number
Now,
$(8^{2k} + 5^{2k}) = (8^2)^k + (5^2)^k = (64^k + 25^k)$
$\because$ k is an odd number (given)
$\therefore$ It is clear from formula (i) that number will always be divisible by (64 + 25) = 89

$S_n = \frac{n}{2}[a + l]$

$S_{20} = \frac{20(20+1)}{2}$

8 × N = N + 2

From option (d),

8 × N = 8 × 6 = 48

Unit digit = 8

8 × 6 = 6 + 2

8 = 8

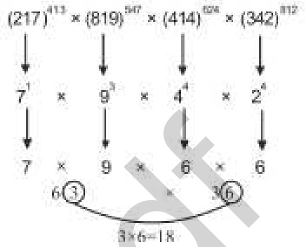
Hence, N = 6

224. What is the unit digit of $(217)^{413}\times(819)^{547}\times(414)^{624}\times(342)^{812}$?

(a) 2 (b) 4 (c) 6 (d) 8

SSC CGL (Tier-II) 17-2-2018

Ans. (d) :



Hence unit digit = 8

225. What percentage of the numbers from 101 to 1000 have 9 in the unit's digit?

(a) 10% (b) 12% (c) 20% (d) 15%

SSC CHSL –19/10/2020 (Shift-I)

Ans. (a) : Required number from 101 to 200 = 10

Hence numbers of such number from 101 to 1000 in which unit digit is 9 = 10 × 9 = 90

Total numbers of numbers from 101 to 1000 = 900

Required % = $\frac{90}{900}\times100 = 10\%$

226. What is the digit at units place in the product (653 × 308 × 402 × 413)?

(a) 4 (b) 3
(c) 2 (d) 8

SSC MTS 7-10-2017 (Shift-I)

Ans. (a) : 653 × 308 × 402 × 413

Unit's digit = 3 × 8 × 2 × 3 = 144

Unit digit = 4

227. If x = $(164)^{169} + (333)^{337} - (727)^{726}$, then what is the unit digit of x ?

(a) 5 (b) 7
(c) 8 (d) 9

SSC CGL (Tier-II) 12-09-2019

Ans. (c) : $x = (164)^{169} + (333)^{337} - (727)^{726}$

For unit digit divide the power over base by 4 and place the remainder as the power of the unit digit of the base number which is left after dividing by 4

$\therefore x = (4)^1 + (3)^1 - (7)^2 = 4 + 3 - 49$

On writing unit digit

$x = 4 + 3 - 9 = -2$

$x = 10 - 2 = 8$

Note– 10 is added to unit digit to make it positive.

228. Let x = $(633)^{24} - (277)^{38} + (266)^{54}$. What is the unit digit of x?
(a) 8 (b) 6 (c) 4 (d) 7
SSC CGL (Tier-II) 11-09-2019

Ans. (a) :
$x = (633)^{24} - (277)^{38} + (266)^{54}$
$= 3^{24} - 7^{38} + 6^{54}$
$= 3^4 - 7^2 + 6^2$
$= 1 - 9 + 6$
$= -2$
$= -2 + 10 = 8$
Unit digits is always positive. So to make it positive, 10 is added.

(a) 775 (b) 625 (c) 1225 (d) 650
SSC MTS 04/09/2023 (Shift-III)

Ans. (b): Required number = HCF of (627 – 2), (15630 – 5) and (3128 – 3)
H.C.F of 625, 15625 and 3125
= 625

230. In a division problem, the divisor is 10 times the quotient and 5 times the remainder. If the remainder is 46, what will be the dividend?
(a) 4874 (b) 4286
(c) 5972 (d) 5336
SSC CHSL (Tier-I) 03/08/2023 (Shift-II)

Ans. (d) : Given that:-
Divisor = 10 × Quotient = 5 × Remainder
Since remainder = 46
So, Divisor = 5×46= 230
Then Quotient = $\frac{\text{Divisor}}{10}$
$= \frac{230}{10} = 23$
So, Dividend= Divisor × Quotient + Remainder
= 230×23+46
= 5290+46 = 5336

(a) 2 (b) 4 (c) 1 (d) 3
SSC CHSL (Tier-I) 04/08/2023 (Shift-III)

Ans. (c) : If dividing a number by 7, the remainder is 1, then dividing the cube of that number by 7, the remainder will be 1.
For example :-
$\frac{8}{7} = 1(\text{Remainder})$ and $\frac{8^3}{7} = \frac{512}{7} = 1(\text{Remainder})$

(a) 1 (b) 6
(c) 9 (d) 8
SSC CGL (Tier-I) 14/07/2023 (Shift-I)

Ans. (d) : $\because \frac{P^n}{P+1} = -1$
According to question -
$\frac{(265)^{4081}}{266} + 9$
$= (-1) + 9$
$= 8$
Hence required remainder = 8.

SSC MTS 08/05/2023 (Shift IInd)

Ans. (d) : From the question,
15–10= 5
25–20 = 5
35–30= 5
40–35= 5
The difference is same
Now LCM of 15, 25, 35 and 40

2	15, 25, 35, 20
2	15, 25, 35, 10
3	15, 25, 35, 5
5	5, 25, 35, 5
5	1, 5, 7, 1
7	1, 1, 7, 1
	1, 1, 1, 1,

LCM = 2×2×2×3×5×5×7

Then required smallest number = 4200–difference
= 4200-5
= 4195

(a) 0 (b) 3
(c) 1 (d) 2

SSC GD Constable 07/02/2023 (Shift Ist)

Ans. (c) : Let quotient is x then,

(a) 1 (b) 2
(c) 3 (d) 0

SSC MTS 04/05/2023 (Shift Ist)

Ans. (d) : Let the number be x

∵ Dividend = Divisor × Quotient + Remainder

According to the question,

On putting k = 1

x = 16 × 1 + 4 = 20

$(x)^2 = (20)^2 = 400$

Now, $\frac{400}{16}$ =0 (Remainder)

Hence required remainder will be 0.

SSC GD Constable 07/02/2023 (Shift Ist)

Ans. (b) : From the question,

6 – 4 = 2,

8 – 6 = 2,

∴ Required smallest number = (LCM of 6, 8 and 10) –2

= 120 – 2

= 118

(a) 14 (b) 4 (c) 7 (d) 28

SSC MTS 11/07/2022 (Shift-I)

Ans. (d) : According to the question,

(a) 24 (b) 25 (c) 20 (d) 26

SSC MTS 26/07/2022 (Shift-III)

(a) 3392 (b) 3360
(c) 3318 (d) 3328

SSC MTS 14/07/2022 (Shift-III)

Ans. (d) : Difference of number and remainder:-

Difference is same
So, LCM of (60, 84, 96)
60 = 12 × 5
84 = 12 × 7
96 = 12 × 8
L.C.M = 12 × 8 × 7 × 5

Ans. (d): From the question :-
16 – 13 = 3
24 – 21 = 3
28 – 25 = 3
The difference is same
So, L.C.M of 16, 24 and 28 = 336

(a) 16 (b) 33
(c) 5 (d) 44

SSC CHSL –30/05/2022 (Shift-I)

Ans. (c) : Let the numbers be x and y.

x = p × 44 + 11
y = q × 44 + 38
So, adding these numbers we get,
x + y = (p × 44 + 11) + (q × 44 + 38)
x + y = (p + q) × 44 + 44 + 5
x + y = 44 (p + q + 1) + 5
Hence, the remainder obtained when of the number by 44 will be 5.

Let the number that divides 624 be N
$\Rightarrow \frac{624}{N}$, Remainder = 53
When it is divisible by 16, it can be written as,
$\frac{(39\times16+53)}{N}$
$\Rightarrow \frac{(39\times16+16\times3+5)}{N}$
∴ Required remainder = 5
Hence, option (a) is correct.

264. **When an integer n is divided by 6, the remainder is 5. What is the remainder if 9n is divided by 6?**
(a) 4 (b) 3
(c) 5 (d) 2

SSC CHSL 15/04/2021 (Shift-II)

@apna_pdf

Ans : (b) When an integer n is divided by 6, the remainder is 5.

$\therefore$ Number = Divisor × Quotient + Remainder

$\Rightarrow n = 6q + 5$

According to the question,

If 9n is divided by 6,

$\therefore 9n = 9(6q + 5)$

$\Rightarrow 9n = 54q + 45$

$\Rightarrow 9n = 54q + 42 + 3$

$\Rightarrow 9n = 6(9q + 7) + 3$

So, 3 is remainder if 9n is divided by 6.

Hence, option (b) is correct.

265. If $31^{47} + 43^{47}$ is divided by 37, the remainder is:

(a) 2 (b) 3

(c) 0 (d) 1

SSC CHSL 09/08/2021 (Shift-III)

Ans. (c) : $(a^n + b^n)$ is divisible by (a + b) if n is an odd number

$\therefore 31^{47} + 43^{47}$ is divisible by (31 + 43) = 74

But 74 is the multiple of 37, so $31^{47} + 43^{47}$ is also exactly divisible by 37.

$\therefore$ Remainder = 0

Hence, option (c) is correct.

266. What is the remainder when we divide $4^{50} + 7^{50}$ by 65?

(a) 1 (b) 2

(c) 0 (d) 3

SSC Sel. Post Phase VIII (G.L.) 09.11.20 (Shift-2)

Ans. (c) : $\frac{4^{50}+7^{50}}{65} = \frac{\left(4^2\right)^{25}+\left(7^2\right)^{25}}{65} = \frac{16^{25}+49^{25}}{65}$

$\because (a^n + b^n)$ is always divisible by (a + b) where n is an odd number

$\therefore 16^{25} + 49^{25}$ is always divisible by (16 + 49) = 65

Hence remainder = 0

267. The ratio of divisor and remainder is 3 : 2 and ratio of divisor and quotient is 7:12. If remainder is 14 then what is the remainder obtained when the dividend is divided by 9?

(a) 3 (b) 6

(c) 4 (d) 5

SSC MTS 21/08/2019 (Shift-I)

Ans. (d) : The ratio of divisor and remainder = 3 : 2

Let the divisor and remainder be 3x and 2x respectively.

And ratio of divisor and quotient = 7 : 12 = 7y, 12y

if remainder = 14 then $2x = 14 \Rightarrow x = 7$

Then, divisor 3x = 3×7 = 21, but divisor is 7y then 7y = 21, y = 3

then quotient 12y = 12×3 = 36

Now, dividend = divisor × quotient + remainder

dividend = 21×36+14 = 770

Then the remainder obtained on dividing the dividend by 9 =

```

  72
  ---

(a) 3 (b) 2
(c) 4 (d) 1
SSC CGL (Tier-II) 21-02-2018

Ans. (a) : Natural numbers between 1000 and 2000 = $1000 < 341\text{ K} + 5 < 2000$
Where K is taken as 3, 4, 5
K = 3 then $341\text{ K} + 5 = 341 \times 3 + 5$
$= 1028$
K = 4 then $341\text{ K} + 5 = 341 \times 4 + 5 = 1369$
K = 5 then $341\text{ K} + 5 = 341 \times 5 + 5$

$= \frac{(5^2)^{35}+(7^2)^{35}}{74}$

$= \frac{25^{35}+49^{35}}{74}$

$\because a^n + b^n$ will be only divisible by (a + b) when n is an odd number

as 35 is odd

Hence $25^{35} + 49^{35}$ will be divisible by 25 + 49 = 74

$\therefore$ remainder = 0

305. When 200 is divided by a positive integer x, the remainder is 12. How many values of x are possible?

(a) 2 (b) 3
(c) 6 (d) 8

SSC Sel. Post Phase VIII (H.L.) 09.11.20 (Shift-I)

Ans. (b) : $\because \frac{200}{x} \Rightarrow$ remainder = 12

$\therefore x > 12$

Then, $\frac{188+12}{x} \Rightarrow$ [All values of x which exactly divided 188]

$188 = 2^2 \times 47^1$

Total factors of 188 = (2 + 1) × (1 + 1) = 6

which means number of total values of x = 6 (but x > 12)

$\therefore x \neq 1,2,4$

The number of total values = (6 – 3) = 3

306. When a certain number is divided by 52, the remainder is 49. When the same number is divided by 13, the remainder is x. What is the value of $\sqrt{5x-1}$?

(a) 11 (b) 6
(c) 8 (d) 7

SSC Sel. Post Phase VIII (H.L.) 09.11.20 (Shift-I)

Ans. (d) : dividend = divisor × quotient + remainder

$D = Q_1 \times 52 + 49$

$D = Q_2 \times 13 + x$

$\because$ 52 is divisible by 13 so we can suppose that D is divisible by 13 and this gives 49 as remainder but again 49 can be divided by 13 ($\because$ 49 > 13)

This gives 10 as remainder which is equal to x

$\therefore \quad \sqrt{5x-1} = \sqrt{5\times10-1} = \sqrt{49} = 7$

307. When $(2^{36} - 1)$ is divided by 9, the remainder is:

(a) 0 (b) 1
(c) 8 (d) 2

SSC Sel. Post Phase VII (M.L.) 15.10.19 (Shift-I)

Ans. (a) : $\frac{(2^{36}-1)}{9}$

$\frac{(2^3)^{12}-1}{9}$

$\frac{8^{12}-1}{9}$

$\frac{(9-1)^{12}-1}{9}$

$\frac{1-1}{9} = 0$

Hence remainder = 0

Ans. (a) :

$$99\frac{11}{99}+99\frac{13}{99}+99\frac{15}{99}+......+99\frac{67}{99}$$

$$= n\times 99+\frac{1}{99}(11+13+15+17+........+67)$$

Hence required number of numbers = 29

330. What is the sum of all natural numbers between 1 and 200 which are multiples of 5?

(a) 3900 (b) 4100

(c) 4155 (d) 4235

SSC MTS 9-10-2017 (Shift-II)

Ans. (a) : Numbers which are multiples of 5 between 1 and 200 = 5, 10, 15, ... 195

The given series is in A.P

where, a = 5 n = 39 l = 195

Hence sum $= \frac{n}{2}(a+l)$ (where l = last term)

$= \frac{39}{2}(5+195) = \frac{39}{2}\times200 = 3900$

331. How many multiples of 5 are there from 1 to 200 which are not multiples of 4.

(a) 40 (b) 30 (c) 25 (d) 35

SSC MTS 10-10-2017 (Shift-II)

Ans. (b) :

Trick:

$\frac{200}{5} = 40$ which denotes the total number of factors of 5 from 1 to 200.

In 40 numbers, the numbers which are multiples of 4, and 5 both L.C.M of 4 and 5 = 20

$\frac{200}{20} = 10$

Hence required numbers = (40 – 10) = 30

332. What is the sum of all 3 digit positive integers divisible by 11?

(a) 44550 (b) 43550

(c) 42550 (d) 45550

SSC MTS 7-10-2017 (Shift-I)

Ans : (a) Three digits numbers which are divisible by 11

110, 121, 132 990

a = 110, d = 11, l = 990

from the formula of AP,

l = a + (n–1)d

990 = 110 + (n–1)×11

$\frac{880}{11} = n-1$

n = 81

Sum $S = \frac{n}{2}\left[a+\ell\right]$

$S = \frac{81}{2}\left[110+990\right]$

$S = \frac{81}{2}\times1100$

S = 44550

333. What is the average of all the natural numbers from 49 to 125?

(a) 85 (b) 87

(c) 88 (d) 86

SSC MTS 05/08/2019 (Shift-I)

Ans. (b) : Given 49, 50, 51, 52 125

first terms (a) = 49

common difference (d) = 50 – 49 = 1

last term (l) = 125

From, $\ell = a+(n-1)\times d$

$125 = 49+(n-1)\times1$

$\Rightarrow (n-1) = 76$

$\Rightarrow n = 77$

Hence sum of natural numbers from 49 to 125

$= \frac{n}{2}(a+\ell)$

$= \frac{77}{2}(49+125)$

$= \frac{77}{2}\times174$

$= 77\times87$

Average of natural number from 49 to 125

(a) 16 (b) 17 (c) 19 (d) 15

SSC MTS 11-10-2017 (Shift-I)

Ans : (b)

Multiples of 6 from 1 to 200 $(n_6) = \frac{198-6}{6} + 1$

$= \frac{192}{6} + 1$

$= 32 + 1 = \boxed{33}$

L.C.M of 6 and 4 which means number of multiples of 12 (n_{12})

$= \boxed{16}$

Numbers of multiples which are multiples of 6 but not multiple of 4 = $n_6 - n_{12}$

$= 33 - 16$

$= \boxed{17}$

335. A T-shirt costs Rs 450 and a jeans costs Rs. 1650. If you buy three T-shirts and two jeans, what is the average price of each garments?

(a) ₹ 920 (b) ₹ 900 (c) ₹ 910 (d) ₹ 930

SSC MTS 14/09/2023 (Shift-II)

Ans. (d) : As per question,

Price of 1 T-shirt = ₹ 450

Then price of 3 T-shirt = 450 × 3 = ₹1350

∵ Price of 1 jeans = ₹1650

Then price of 2 jeans = 1650× 2 = ₹ 3300

∴ Required Average $= \frac{1350+3300}{5} = \frac{4650}{5}$

= ₹ 930

336. Rewa has some hens and some goats. If the total number of head of animals is 100 and the total number of feet of animals is 348. How many goats does rewa have?

(a) 74 (b) 80 (c) 76 (d) 55

SSC CGL (Mains) 03/03/2023

Ans. (a) According to question

Then as per question ,x + y = 100 —— (1)

$2x + 4y = 348$

$x + 2y = 174$ —— (2) ... (ii)

From equation (1) & (2)

$x + 2y = 174$

$x + y = 100$

$y = 74$

Therefore, the number of goats = 74

337. The cost of 2 pencils and 3 pens is Rs 55 and the cost of 7 pencils and 2 pens is Rs 65. What is the total cost of a pen and a pencil?

(a) 25 (b) 15 (c) 20 (d) 12

SSC CGL Mains 26/10/2023

Ans. (c) : Let the cost of one pencil = x

and the cost of one pen = y

According to the question,

2x +3y = 55 ____(i)

From equation (i)× 2 and eq. (ii) ×3

Then,

$21x + 6y = 195$

$4x + 6y = 110$

$17x = 85$

x = 5

From eq (i)

2×5+3y = 55

$\boxed{y = 15}$

Cost of one pencil = ₹5

And cost of one pen = ₹15

Total cost of a pen and a pencil = 5 +15 = ₹20

338. The sum of cubes of two given numbers is 10234, while the sum of the given two number is 34. What is the positive difference between the cubes of the two given numbers ?

(a) 3484 (b) 8602
(c) 3356 (d) 3488

SSC CHSL (Tier-I) 11/08/2023 (Shift-I)

Ans. (a) : According to question:-

$x^3 + y^3 = 10234$

$x + y = 34$

∵ $(x + y)^3 = x^3 + y^3 + 3xy(x + y)$

$34^3 = 10234 + 3xy(34)$

$3xy = \frac{39304-10234}{34}$

$3xy = 855$

$xy = 285$

∵ $(x-y)^2 = (x+y)^2 - 4xy$

$(x - y)^2 = (34)^2 - 4 \times 285$

$= 1156 - 1140$

$(x - y)^2 = 16$

$x - y = 4$

∴ $x^3 - y^3 = (x - y)^3 + 3xy(x - y)$

$= 4^3 + 3 \times 285 \times 4$

$= 64 + 3420$

$= 3484$

@apna_pdf

$(a+b)^2 = 18^2+4\times144$

$(a+b)^2 = 900$
$\Rightarrow (a+b) = 30$
$\Rightarrow (a-b) = 18$
$a = \frac{30+18}{2}$, $b = \frac{30-18}{2}$
$\boxed{a = 24}$ $\boxed{b = 6}$
Hence,
$a^2 - b^2 = 24^2 - 6^2 = 576 - 36$
$= 540$

$\therefore \quad x^3 + y^3 = (x + y)^3 - 3xy (x + y)$
$9728 = 32768 - 3xy (32)$
$3xy = \frac{32768 - 9728}{32}$
$3xy = 720$

$(x+y) = 28$
$xy = 192$
$\Rightarrow (x-y) = \sqrt{(x+y)^2 - 4xy}$
$\Rightarrow \sqrt{784 - 4 \times 192}$
$= \sqrt{784 - 768}$
$= x - y = \sqrt{16} = 4$
$\Rightarrow (x + y) = 28$
$(x - y) = 4$

$xy = 135$ ……..(1)
$x = \frac{135}{y}$
$5x + 10y = 165$
$x + 2y = 33$ …….(2)
Put the value of $(x = 135/y)$ from eq. (1)
$\Rightarrow \frac{135}{y} + 2y = 33$
$\Rightarrow 135 + 2y^2 = 33y$

SSC CGL (Tier-II) 08/08/2022 (Shift-I)

Ans. (d) : Let the two digit number be 10x + y
If the digits of the number are reversed then the number becomes 10y + x
As per question , (10y + x) = 10x+y–36
9 (x–y) = 36
(x–y) = 4 ... (i)
(I) From the above equation (i) it is clear that the difference of digit is 4
∴ statement (I) is correct.
(II) If the number is 84, then on reversing the digit it becomes 48
Difference on reversing the digits = (84 – 48) = 36
∵ The original number reduces to 36 on reversing
∴ This statement is also correct.
(III) If we take a prime number 73, then on reversing the digit we get 37 Difference on reversing the digits = (73 – 37) = 36
∵ Number is not always a composite number
∴ Statement (III) is not correct.
Hence, I and II statement is correct.

359. How many composite numbers are there from 53 to 97.
(a) 35 (b) 36
(c) 37 (d) 38
SSC CGL (Tier-II) 08/08/2022 (Shift-I)

Ans. (a) : Prime numbers from 53 to 97 are
= 53, 59, 61, 67, 71, 73, 79, 83, 89, 97 = 10 (total)
Total numbers from 53 to 97 = 45
∴ Composite number from 53 to 97 = 45–10
= 35

360. Two mixers and one T.V cost Rs 500, while two TVs and one mixer cost Rs 700. What is the cost of a TV ?
(a) ₹100 (b) ₹200
(c) ₹300 (d) ₹400
SSC MTS 08/07/2022 (Shift-III)

Ans. (c) : Let the cost of one mixer = ₹x
and the cost of one TV = ₹y
As per question :-
2 x + y = 500 ….(i)
x + 2 y = 700 ….(ii)
On multiplying equation (ii) by 2 and subtracting equation (i)

$$\begin{array}{r} 2x+4y=1400 \\ 2x+y=500 \\ -\quad-\quad- \\ \hline 3y=900 \\ y=300 \end{array}$$

So the cost of one TV is ₹300

361. If N = 1+11+111+1111+ .... + 111111111, then what is the sum of the digits of N ?

SSC CPO SI 10/11/2022 (Shift IInd)
SSC CGL (Tier II) 19-02-2018

Ans. (a) : N = 1+11+111+1111+ .... + 111111111
Digits in N = 1+2+3+4+……….+9

$$\therefore \text{ Sum of digits of } N=\frac{n(n+1)}{2}=\frac{9\times10}{2}=45$$

362. 13 a, b and c are four different numbers and the HCF of each pair of numbers (13, a); (13, b) and (13, c) is 13, where a, b, c each are less than 60, and a < b < c. What is the value of $\frac{a+c}{b}$?
(a) 2 (b) 3.5 (c) 5 (d) 4.5
SSC CGL 13/04/2022 (Shift-I)

Ans. (a) : Four numbers are 13, a, b and c
HCF of (13, a) (13, b) (13, c) = 13
a, b, c < 60 .... (I)
a < b < c .... (II)
a, b, c should be multiple of 13 as the HCF is 13.
So a = 26, b = 39, c = 52
These all satisfy the conditions.
So, the numbers are 13, 26, 39 and 52
Hence, $\frac{a+c}{b}=\frac{26+52}{39}=\frac{78}{39}=2$

363. What is the value of 603 × 597 ?
(a) 359991 (b) 359997
(c) 360003 (d) 359996
SSC MTS 11-10-2017 (Shift-II)

Ans. (a) : 603 × 597 = ?
= (600 + 3) × (600 – 3)

= 359991

364. The average of 1088 real numbers is zero. At most how many of them can be negative?
(a) 544 (b) 1087 (c) 100 (d) 88
SSC CHSL 11/07/2019 (Shift-I)

Ans. (b) : Since the average of 1088 real numbers will be zero. Hence the maximum negative numbers can be 1087 while 1088 number will be such number that the sum becomes zero i.e positive.

Trick:
According to question,

$$\frac{x_1+x_2+x_3+X_4.........+x_{1088}}{1088}=0$$

$\therefore \quad x_1 + x_2 + x_3 + x_4 + ...+ x_{1088} = 0$
The maximum number of negative real numbers can be 1087 out of 1088 and the value of remaining positive number will be such that it is equal to the sum of 1087 negative real numbers.

365. The number 1563241234351 is:

(b) neither divisible by 3 nor by 11
(c) divisible by 3 but not by 11
(d) divisible by 11 but not by 3
SSC CPO-SI 13/12/2019 (Shift-II)

Ans. (b) Sum of digits number 1563241234351 = 40
(which is not divisible by 3)
Hence the number will not divisible by 3
Again, Sum of digits of odd places ~ Sum of digits of even places
⇒ (1 + 3 + 3 + 1 + 2 + 6 + 1) ~ (5 + 4 + 2 + 4 + 3 + 5)
⇒ 17 ~ 23
⇒ 6 (which is neither divisible 11 nor zero)
Hence the number is not divisible by 11

367. In a two-digit number, its unit digit exceeds its tens digit by 2 and that the product of the given number and the sum of its digits is equal to 460. The number is:

(a) 48 (b) 64 (c) 36 (d) 46

SSC CGL (Tier-II)-2019 – 18/11/2020

Ans. (d) : From option (d),

Hence 46 ×10 = 460

∴ number is 46

368. If $56 \times 75 \times 60 \times 84 \times 210 = 2^p \times 3^q \times 5^r \times 7^s$, then what is the value of [(p+q)/s]+r ?

(a) 6 (b) 8 (c) 12 (d) 10

SSC CGL (Tier-II) 18-02-2018

Ans. (b) :

$56 \times 75 \times 60 \times 84 \times 210 = 2^p \times 3^q \times 5^r \times 7^s$

$2^8 \times 3^4 \times 5^4 \times 7^3 = 2^p \times 3^q \times 5^r \times 7^s$

On comparing the powers,

p = 8, q = 4, r = 4, s = 3

On substituting the value of p, q, r and s in

$$\left[\frac{(p+q)}{s}\right]+r$$

$$\left[\frac{8+4}{3}\right]+4=8$$

(a) 2997 (b) 1000

(c) 1998 (d) Both 2997 and 1998

SSC CGL (Tier-II) 9-3-2018

Ans. (d) : A = 0.abc abc ....

$A = 0.\overline{abc}$

$$A = \frac{abc}{999}$$

So, to get an integral value A should be multiply by any multiple of 999.

2997 = 999 × 3

1998 = 999 × 2

(x+y) (x–y) = 56

x – y = 4 .... (3)

On solving equation (1) and (3),

(a) 3 (b) 4

(c) 5 (d) 6

SSC CGL (Tier-II) 17-2-2018

Ans. (c) : A + B + AB = 65

372. When a two-digit number is multiplied by the sum of its digits, the product is 424. When the number obtained by interchanging its digits is multiplied by the sum of the digits, the result is 280. The sum of the digits of the given number is:

(a) 9 (b) 8

(c) 7 (d) 6

According to the second condition,

$$(10y+x)=\frac{280}{(x+y)}\text{...........(II)}$$

By adding Equation (i) and equation (ii),

$$(11x+11y)=\frac{704}{(x+y)}$$

$$(x+y)=\frac{64}{(x+y)}$$

$(x+y)^2 = 64$

∴ (x+y) = 8

(a) 1754 (b) 1801

(c) 2961 (d) 1875

SSC CHSL –17/03/2020 (Shift-III)

Ans. (b) : Let the two numbers be a & b respectively then,

a + b = 59, ab = 840

∴ $(a + b)^2 = a^2 + b^2 + 2ab$

$(59)^2 = a^2 + b^2 + 2 \times 840$

$3481 = a^2 + b^2 + 1680$

$a^2 + b^2 = 3481 – 1680$

Hence $a^2 + b^2 = 1801$

374. If the difference between two numbers is 6 and the difference between their squares is 60, what is the sum of their cubes?

(a) 945 (b) 678

(c) 894 (d) 520

SSC CHSL –17/03/2020 (Shift-III)

@apna_pdf

Ans. (d) Let there be two numbers a and b respectively
According to question,

$a - b = 6$, ...(i)
$a^2 - b^2 = 60$
$\because$ $a^2 - b^2 = (a - b)(a + b)$
$60 = 6(a + b)$
$a + b = 10$ ....(ii)
From eq (i) & (ii),
$a = 8, b = 2$
$\therefore$ $(a + b)^3 = a^3 + b^3 + 3ab(a + b)$
$10^3 = a^3 + b^3 + 3 \times 8 \times 2\ (10)$
$1000 = a^3 + b^3 + 480$
$a^3 + b^3 = 1000 - 480$
$a^3 + b^3 = 520$
Hence the sum of cubes of numbers = 520

(a) 18 (b) 36 (c) 63 (d) 81

SSC CHSL –15/10/2020 (Shift-II)

Ans. (c) : Let two numbers be a and b respectively
According to question,
$a - b = 3$
$a^3 - b^3 = 999$
$\therefore (a - b)^3 = a^3 - b^3 - 3ab(a - b)$
$3^3 = 999 - 3ab \times 3$
$27 = 999 - 9ab$
$9ab = 999 - 27$
$9ab = 972$
$ab = 108$
$\therefore (a-b)^2 = (a+b)^2 - 4ab$
$3^2 = (a+b)^2 - 4 \times 108$
$(a+b)^2 = 9 + 432$
$(a+b)^2 = 441$
$a+b = 21$
$\therefore a^2 - b^2 = (a-b)(a+b) = 3 \times 21 = 63$

376. The sum of two numbers is 47 and their product is 550. Find the sum of their squares.
(a) 1109 (b) 876

SSC CHSL –15/10/2020 (Shift-II)

Ans. (a) : Let two numbers be a and b respectively
$\because a + b = 47$, $ab = 550$
$\therefore (a + b)^2 = a^2 + b^2 + 2ab$
$(47)^2 = a^2 + b^2 + 2 \times 550$
$2209 = a^2 + b^2 + 1100$
$a^2 + b^2 = 2209 - 1100$
Hence $a^2 + b^2 = 1109$

$\Rightarrow (11)^2 = 65 + 2xy$
$\Rightarrow 121 = 65 + 2xy$
$\Rightarrow 2xy = 56$
$\Rightarrow xy = 28$ ____ (iii)
$(x+y)^3 = x^3 + y^3 + 3xy(x+y)$
Substituting values from equation (i), (ii) and (iii)
$\Rightarrow (11)^3 = x^3 + y^3 + 3 \times 28 \times 11$
$\Rightarrow 1331 = x^3 + y^3 + 924$
$\Rightarrow x^3 + y^3 = 407$

Ans. (d) : On writing the data in ascending order

24, 24, 26, 26, 26, 28, 31, 32

Mode = 26

393. What is the mode of the given data?
21, 22, 23,23, 24, 21, 22, 23, 21, 23, 24, 23, 21, 23

(a) 23 (b) 21 (c) 22 (d) 24

SSC GD Constable 13/02/2019 (Shift-I)

Ans. (a) : On writing the series in ascending order

= 21, 21, 21, 21, 22, 22, 23, 23, 23, 23, 23, 23, 24, 24

$\because$ In series term (23) come maximum times

So, mode $= 23$

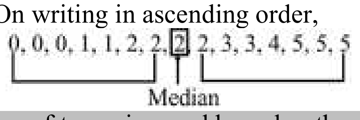
In series the term which is more frequent is called mode

394. A bowler has taken 0, 3, 2, 1, 5, 3, 4, 5, 5, 2, 2, 0, 0, 1 and 2 wickets in 15 consecutive matches. What is the median of the given data?

(a) 1 (b) 3 (c) 0 (d) 2

SSC GD Constable 11/02/2019 (Shift-II)

Ans. (d) : On writing in ascending order,



If the number of terms is an odd number then the middle term will be median.

395. If A = 1 – 10 + 3 – 12 + 5 – 14 + 7 + ... upto 60 terms, then what is the value of A ?

(a) –360 (b) –310
(c) –240 (d) –270

SSC CGL (Tier-II) 21-02-2018

Ans. (d) : Given

A = 1–10 + 3 – 12 + 5 – 14 + 7 + ... up to 60 terms

A = (1–10) + (3–12) + (5–14) + 7 + ... up to 60 terms

$\Rightarrow$ A = –9 – 9 – 9 – .... 30 terms

$\Rightarrow A = -9 \times 30$

$\Rightarrow \boxed{A = -270}$

396. Which of the following statement(s) is/are TRUE ?

I. The total number of positive factors of 72 is 12

II. The sum of first 20 odd numbers is 400

III. Largest two digit prime number is 97

(a) Only I and III (b) Only II and III
(c) Only I and III (d) All are true

SSC CGL (Tier-II) 20-02-2018

Ans. (d) I. $72 = 8 \times 9 = 2^3 \times 3^2$

Number of factor = (3+1) (2+1)

= 12

Statement I is correct

II. Sum of first n odd numbers = n^2 [$\because$ n= given = 20]

Sum of first 20 odd numbers = $20^2 = 400$

It is also correct

III. Largest two digit prime number = 97 (correct)

Thus all the statements are true

397. If x and y are natural numbers such that x + y = 2017, then what is the value of $(-1)^x + (-1)^y$?

(a) 2 (b) –2
(c) 0 (d) 1

SSC CGL (Tier-II) 19-02-2018

Ans. (c) : x + y = 2017

If x is even number then y will be odd

$(-1)^x + (-1)^y = (-1)^{even} + (-1)^{odd} = 1 - 1 = 0$

398. If $(3^{33} + 3^{33} + 3^{33})(2^{33} + 2^{33}) = 6^x$ then what is the value of ?

(a) 34 (b) 35
(c) 33 (d) 33.5

SSC CGL (Tier-II) 18-02-2018

Ans. (a) : Given, $(3^{33} + 3^{33} + 3^{33})(2^{33}+2^{33}) = 6^x$

$\Rightarrow 3^{33}(1+1+1)\,2^{33}(1+1) = 6^x$

$3^{33} \times 3 \times 2^{33} \times 2 = 6^x$

$3^{34} \times 2^{34} = 6^x$

$(2\times3)^{34} = 6^x$

On comparing the powers,

x = 34

399. How many three digit numbers are there in which all the digits are odd?

(a) 100 (b) 125
(c) 500 (d) 250

SSC CGL (Tier-II) 18-02-2018

Ans. (b) : The smallest three digit number in which all digits are odd $= 111$

The largest three digit number in which all digits are odd $= 999$

@apna_pdf

Total required no's between 111 and 199 = 5×5 = 25
Total required no's between 311 and 399 = 5×5 = 25
Total required no's between 511 and 599 = 5×5 = 25
Total required no's between 711 and 799 = 5×5 = 25
Total required no's between 911 and 995 = 5×5 = 25
Total numbers = 25 × 5 = 125

400. If the sum of ten different positive integers is 100, then what is the greatest possible number among these 10 numbers?
(a) 45 (b) 91
(c) 55 (d) 64

SSC CGL (Tier-II) 18-02-2018

Ans. (c) : Let x be the largest numbers among the positive numbers
According to question
(1 + 2 + 3 + ...+ 9) + x

Sum of n numbers $= \frac{n(n+1)}{2}$

$100 = \left(\frac{9\times10}{2}\right) + x$
100 = 45 + x
x = 55

401. The students of a class donated a sum of ₹2,809 to the Fund. Each student donated as many rupees as the number of students in the class. The number of students in the class is:
(a) 51 (b) 47 (c) 53 (d) 49

SSC CPO-SI 24/11/2020 (Shift-I)

Ans. (c) : Let the number of students in the class = x
The amount donated by 1 student $= \frac{2809}{x}$
According to the question,
∵ Amount donated by 1 student = Number of Students.
$\frac{2809}{x} = x$
$x^2 = 2809$
$x = \sqrt{2809}$
x = 53

402. The students of a class donated a sum of ₹2,209. If each student donated a many rupees as the number of students in the class, then the number of students in the class is:
(a) 47 (b) 49
(c) 53 (d) 51

SSC CPO-SI 23/11/2020 (Shift-II)

Ans. (a) : Let the number of students in the class = x
Then the amount donated by each student = ₹x
According to the question,
x × x = 2209
$x^2 = 2209$
$x = \sqrt{2209}$
x = 47
Hence, the number of student in the class = 47

403. What is the value of $\frac{1}{0.2}+\frac{1}{0.02}+\frac{1}{0.002}+$... upto 9 terms?
(a) 222222222 (b) 111111111
(c) 555555555 (d) 525252525

SSC CGL (Tier-II) 19-02-2018

Ans. (c): $\frac{1}{0.2}+\frac{1}{0.02}+\frac{1}{0.002}+$..........9 terms
= 5 + 50 + 500 + ... 9 terms
= 5 [1+10+100+..........9 terms]
∵ It is a geometric series.
We know that,
Sum of geometric series $= \frac{a(r^n-1)}{r-1}$, when r > 1

$= 5\left[\frac{1(10^9-1)}{10-1}\right] = 5\times\frac{999999999}{9}$
= 555555555

404. Which of the following statement(s) is/are TRUE ?
I. $1^{99} + 2^{99} + 3^{99} + 4^{99} + 5^{99}$ is exactly divisible by 5.
II. $31^{11} > 17^{14}$
(a) Only I (b) Only II
(c) Neither I nor II (d) Both I and II

SSC CGL (Tier-II) 9-3-2018

Ans. (a) : $1^{99} + 2^{99} + 3^{99} + 4^{99} + 5^{99}$
As cyclicity of 2, 3 is 4 and cyclicity of 4 is 2
$\therefore 1 + 2^3 + 3^3 + 4^1 + 5$
= 1 + 8 + 27 + 4 + 5 = 45
Hence this is divisible by 5
(II). $(31)^{11} > (17)^{14}$
$(31)^3\times(31)^3\times(31)^3\times(31)^2 > (17)^4\times(17)^4\times(17)^4\times(17)^2$
∵ $(31)^3 = 29791$ and $(17)^4 = 83521$
Almost thrice of $(17)^4$, $(31)^3$
Hence, it is false.

405. The sum of two numbers is 7 and their product is 12. What is the sum of their reciprocals?
(a) $\frac{7}{12}$ (b) $\frac{8}{15}$
(c) $\frac{7}{13}$ (d) $\frac{12}{7}$

SSC MTS 10-10-2017 (Shift-II)

Ans. (a) : Let the two number be a and b
According to question,
a + b = 7
a×b = 12
Sum of reciprocals $= \frac{1}{a}+\frac{1}{b}$
$= \frac{a+b}{ab} = \frac{7}{12}$

02. Decimal and Fraction

(I) Problems based on finding smallest and largest fractions

1. Which of the following ratio is the largest?
2 : 5, 1 : 2, 8 : 15, 3 : 5

(a) 1 : 2 (b) 8 : 15
(c) 3 : 5 (d) 2 : 5

SSC MTS 09/05/2023 (Shift Ist)

Ans. (c) : $2 : 5 \Rightarrow \frac{2}{5} = 0.4$

$1 : 2 \Rightarrow \frac{1}{2} = 0.5$

$8 : 15 \Rightarrow \frac{8}{15} = 0.53$

$3 : 5 \Rightarrow \frac{3}{5} = 0.6$

Hence, the largest ratio will be (3 : 5)

Method II-

$\frac{2}{5}, \frac{1}{2}, \frac{8}{15}, \frac{3}{5}$

On equalizing each,

$= \frac{2\times6}{5\times6}, \frac{1\times15}{2\times15}, \frac{8\times2}{15\times2}, \frac{3\times6}{5\times6}$

$= \frac{12}{30}, \frac{15}{30}, \frac{16}{30}, \frac{18}{30}$

Hence, the largest, fraction is $\frac{18}{30}$, whose ratio will be (3:5)

2. Find the correct descending order of the following ratio.

$\mathbf{\frac{17}{30}, \frac{7}{15}, \frac{27}{50}, \frac{11}{20}}$

(a) $\frac{17}{30} > \frac{27}{50} > \frac{11}{20} > \frac{7}{15}$ (b) $\frac{17}{30} > \frac{11}{20} > \frac{27}{50} > \frac{7}{15}$

(c) $\frac{7}{15} > \frac{11}{20} > \frac{27}{50} > \frac{17}{30}$ (d) $\frac{11}{20} > \frac{17}{30} > \frac{27}{50} > \frac{7}{15}$

SSC CHSL Tier- II 26/06/2023

Ans.(b) $\frac{17}{30}, \frac{7}{15}, \frac{27}{50}, \frac{11}{20}$

L.C.M of 30, 15, 50, and 20 = 300

$\frac{170}{300}, \frac{140}{300}, \frac{162}{300}, \frac{165}{300}$

Descending order- $\frac{170}{300} > \frac{165}{300} > \frac{162}{300} > \frac{140}{300}$

Or $\boxed{\frac{17}{30} > \frac{11}{20} > \frac{27}{50} > \frac{7}{15}}$

3. Which of the following fractions is the smallest?

$\mathbf{\frac{5}{11}, \frac{7}{12}, \frac{8}{13}, \frac{9}{17}}$

(a) $\frac{5}{11}$ (b) $\frac{7}{12}$ (c) $\frac{8}{13}$ (d) $\frac{9}{17}$

SSC CGL (Tier-II) 08/08/2022 (Shift-I)

Ans. (a) : From options,

$\frac{5}{11} = 0.45$

$\frac{7}{12} = 0.58$

$\frac{8}{13} = 0.61$

$\frac{9}{17} = 0.52$

Hence, fraction $\frac{5}{11}$ is the smallest fraction.

4. Which of the following statements is/are true?
I. 3/72 < 5/91 < 7/99
II. 11/135 > 12/157 > 13/181

(a) Only I (b) Only II
(c) Both I and II (d) Neither I nor II

SSC CPO SI 9/11/2022 (Shift Ist)

Ans. (c) : According to the question–

I. $\frac{3}{72} < \frac{5}{91} < \frac{7}{99}$

$0.041 < 0.054 < 0.07$

II. $\frac{11}{135} > \frac{12}{157} > \frac{13}{181}$

$0.081 > 0.076 > 0.071$

Hence, It is clear that, Both statement I and II are true.
So, option (c) is correct.

5. Which of the following statements is/are true?

I. $\mathbf{11\frac{1}{2} + 17\frac{3}{4} - 5\frac{1}{5} - 2\frac{1}{10} = \frac{439}{20}}$

II. $\mathbf{\frac{9}{1078} > \frac{11}{1127} > \frac{12}{1219}}$

III. $\mathbf{\frac{149}{151} > \frac{153}{155} > \frac{157}{159}}$

(a) Only I (b) Only II
(c) Only III (d) There is no truth

SSC CPO SI 9/11/2022 (Shift I[st])

Ans. (a) : From statement : –

I. $11\frac{1}{2}+17\frac{3}{4}-5\frac{1}{5}-2\frac{1}{10}=\frac{439}{20}$

L.H.S.

$=\frac{23}{2}+\frac{71}{4}-\frac{26}{5}-\frac{21}{10}$

$=\frac{117}{4}-\frac{73}{10}=\frac{585-146}{20}=\frac{439}{20}=$ R.H.S.

II. $\frac{9}{1078} > \frac{11}{1127} > \frac{12}{1219}$

By cross multiplication–

10143 < 11858, 13409 < 13524

This statement is false

III. $\frac{149}{151} > \frac{153}{155} > \frac{157}{159}$

By cross multiplication.

149 × 155 153 × 151, 153 × 159 155 × 157

23095 < 23103 24327 < 24335

This statement is false.

It is clear that statement I is true.

6. Which of the following is the greatest?
11/12, 3/4, 10/11

(a) 11/12 (b) 3/4
(c) 10/11 (d) All are equal

SSC MTS 11-10-2017 (Shift-III)
SSC CHSL (Tier-I) 14/03/2023 (Shift-II)

Ans. (a) : $\frac{11}{12},\frac{3}{4},\frac{10}{11}$

L.C.M of 12, 4 and 11 = 132

$\frac{11}{12}\times132,\frac{3}{4}\times132,\frac{10}{11}\times132$

121,99,120

Hence, $\frac{11}{12}$ is the greatest fraction.

7. If $P=\frac{96}{95\times97}, Q=\frac{97}{96\times98}$ and $R=\frac{1}{97}$, then which of the following is TRUE?

(a) P < Q < R (b) R < Q < P
(c) Q < P < R (d) R < P < Q

SSC CGL (Tier-II) 20-02-2018

Ans. (b) : Let 95 = 1, 96 = 2, 97 = 3, 98 = 4

$P=\frac{2}{1\times3}=0.67$

$Q=\frac{3}{2\times4}=0.375$

$R=\frac{1}{3}=0.33$

Hence option P > Q > R is TRUE

8. Which of the following statement(s) is/are TRUE ?

I. $1\frac{2}{3}+2\frac{3}{4}+3\frac{4}{5}>8$

II. $6\frac{1}{2}-5\frac{3}{4}+4\frac{1}{4}>5$

(a) Only I (b) Only II
(c) Neither I nor II (d) Both I and II

SSC CGL (Tier-II) 9-3-2018

Ans. (a) :

From statement– I

$1\frac{2}{3}+2\frac{3}{4}+3\frac{4}{5}$

$=(1+2+3)+\frac{2}{3}+\frac{3}{4}+\frac{4}{5}$

= 6+ 0.66 + 0.75 + 0.8

= 8.21 > 8 (correct)

From statement–II

$6\frac{1}{2}-5\frac{3}{4}+4\frac{1}{4}$

$=(6-5+4)+\frac{1}{2}-\frac{3}{4}+\frac{1}{4}$

$=5 \not> 5$ (Incorrect)

Hence, it is clear that only statement I is TRUE.

9. Which of the following statement(s) is/are TRUE?

I. 3/71 < 5/91 < 7/99

II. 11/135 > 12/157 > 13/181

(a) Only I (b) Only II
(c) Both I and II (d) Neither I nor II

SSC CGL (Tier-II) 21-02-2018

Ans. (c): From statement–I

$\frac{3}{71}<\frac{5}{91}<\frac{7}{99}$

On approximating–

$\frac{3}{72}<\frac{5}{90}<\frac{7}{98}$

$\frac{1}{24}<\frac{1}{18}<\frac{1}{14}$ (true)

From statement –II

$\frac{11}{135}>\frac{12}{157}>\frac{13}{181}$

On approximating–

$\frac{11}{132}>\frac{12}{156}>\frac{13}{182}$

$\frac{1}{12}>\frac{1}{13}>\frac{1}{14}$ (true)

Hence both statement I and II are true.

Ans. (d) : A = 0.142857142857....

$= 0.\overline{142857}$

$= \frac{142857}{999999} = \frac{1}{7}$

B = 0.1666...... $= 0.1\overline{6}$

$= \frac{16-1}{90} = \frac{15}{90} = \frac{1}{6}$

Hence, $\frac{A+B}{AB} = \frac{1}{B} + \frac{1}{A}$ = 6 + 7 = 13

16. Three fractions x, y and z are such that x > y > z. When the smallest of them is divided by the greatest, the result is $\frac{9}{16}$, which exceeds y 0.0625. If x+y+z = $2\frac{3}{12}$, then find the value of (x+z).

(a) $\frac{7}{4}$ (b) $\frac{3}{4}$ (c) $\frac{1}{4}$ (d) $\frac{5}{4}$

SSC CGL (Tier-II) 29/01/2022 (Shift-I)

Ans. (a) : There are three fractions x, y and z

According to question

$\frac{z}{x} = \frac{9}{16}$

and $y = \frac{9}{16} - 0.0625$

$= \frac{9}{16} - \frac{625}{10000}$

$= \frac{9}{16} - \frac{1}{16} = \frac{8}{16} = \frac{1}{2}$

$\because x + y + z = 2\frac{3}{12} = \frac{27}{12}$

(x+z) + y = $\frac{27}{12}$

$\Rightarrow (x+z) = \frac{27}{12} - y = \frac{27}{12} - \frac{1}{2} = \frac{7}{4}$

$\Rightarrow x + z = \frac{7}{4}$

17. If $x = \frac{1}{1+\frac{1}{1+x}}$ and $y = \frac{2}{2+\frac{1}{1+y}}$ then which of the following can be the value of x + y ?

(a) $\left(-\sqrt{5}-\sqrt{17}+3\right)/4$ (b) $\left(2\sqrt{5}+\sqrt{17}-3\right)/4$

(c) $\left(-\sqrt{5}+\sqrt{17}+1\right)/4$ (d) $\left(\sqrt{5}+\sqrt{17}-1\right)/4$

SSC CPO SI 9/11/2022 (Shift I[st])

Ans. (b) : $x = \frac{1}{1+\frac{1}{1+x}}$

$x = \frac{1}{\frac{2+x}{1+x}} = \frac{1+x}{2+x}$

$2x + x^2 = 1 + x$

$x^2 + x - 1 = 0$

$\therefore x = \frac{-1 \pm \sqrt{1+4}}{2}$

$x = \frac{\sqrt{5}-1}{2}$

Thus,

$y = \frac{2}{2+\frac{1}{1+y}}$

$y = \frac{2}{\frac{3+2y}{1+y}} = \frac{2+2y}{3+2y}$

$3y + 2y^2 = 2 + 2y$

$2y^2 + y - 2 = 0$

$y = \frac{-1 \pm \sqrt{1+16}}{4}$

$y = \frac{\sqrt{17}-1}{4}$

Hence, $x + y = \frac{\sqrt{5}-1}{2} + \frac{\sqrt{17}-1}{4} = \frac{2\sqrt{5}+\sqrt{17}-3}{4}$

(c) $\frac{1}{3}$ (d) $\frac{2}{3}$

SSC CGL (Tier-II) 11-9-2019

Ans. (b) : According to question -

$\frac{c}{a}=\frac{5}{2}=b+\frac{7}{4}$

$b=\frac{5}{2}-\frac{7}{4}=\frac{3}{4}$

Let c = 5x and a = 2x

According to question,

$a+b+c=1\frac{11}{12}=\frac{23}{12}$

$2x+\frac{3}{4}+5x=\frac{23}{12}$

$7x=\frac{23}{12}-\frac{3}{4}=\frac{14}{12}$

$x=\frac{1}{6}$

$\therefore$ c–a = 5x – 2x = 3x

$=3\times\frac{1}{6}=\frac{1}{2}$

1. **Find the value of the given expression.**

$$\sqrt{20-\sqrt{20-\sqrt{20-\sqrt{20-.....\infty}}}}$$

(a) 5 (b) 2
(c) 6 (d) 4

SSC CGL (Mains) 03/03/2023

Ans. (d) From question,

$x=\sqrt{20-\sqrt{20-\sqrt{20-........\infty}}}$

On squaring both side

$x^2=20-\sqrt{20-\sqrt{20-\sqrt{20.......\infty}}}$

$x^2=20-x$ (From equation (i))

$x^2+x-20=0$

$x^2+5x-4x-20=0$

$x(x+5)-4(x+5)=0$

$(x-4)(x+5)=0$

$x-4=0$

$\boxed{x=4}$

2. **Find the value of the given expression.**

$$\sqrt{8+\sqrt{1681}}$$

(a) 5 (b) 6 (c) 4 (d) 7

SSC CGL (Mains) 02/03/2023

Ans. (d) : $\sqrt{8+\sqrt{1681}}=\sqrt{8+41}=\sqrt{49}=7$

3. **If $X=\sqrt{64}+\sqrt{121}-\sqrt{169}$ then, what is the value of x^2 ?**

(a) 25 (b) 16 (c) 36 (d) 49

SSC CGL Mains (Tier-II) 07/03/2022

Ans. (c) : According to the question ,

$X=\sqrt{64}+\sqrt{121}-\sqrt{169}$

$=8+11-13$

18. Comparing the following two numerical expressions, we find that.

$[(2\frac{7}{9})^{2\frac{1}{2}}]^{\frac{3}{5}}$ and $[(1\frac{2}{3})^{5}]^{\frac{3}{5}}$

(a) The first expression is smaller than the second
(b) The first expression is greater than the second
(c) Both the given expression cannot be compared
(d) Both the expressions are equal

SSC MTS 14/09/2023 (Shift-II)

Ans. (d) : According to the question,

$\left[\left(2\frac{7}{9}\right)^{2\frac{1}{2}}\right]^{\frac{3}{5}}$ and $\left[\left(1\frac{2}{3}\right)^{5}\right]^{\frac{3}{5}}$

$\left[\left(\frac{25}{9}\right)^{\frac{5}{2}}\right]^{\frac{3}{5}}$ and $\left[\left(\frac{5}{3}\right)^{5}\right]^{\frac{3}{5}}$

$\left(\frac{25}{9}\right)^{\frac{5}{2}\times\frac{3}{5}}$ and $\left(\frac{5}{3}\right)^{5\times\frac{3}{5}}$

$\left[\left(\frac{25}{9}\right)^{\frac{1}{2}}\right]^{3}$ and $\left(\frac{5}{3}\right)^{3}$

$\left(\frac{5}{3}\right)^{3}$ and $\left(\frac{5}{3}\right)^{3}$

Therefore, on comparing both the numerical expressions, it is clear that both the expressions are equal.

19. Which number can come in place of the question mark (?) in the following equation?
$(0.064)^{123} \div 0.16^{47} \times 0.4^{34} \times 0.4^{29} = (0.4)^{?}$

(a) 320 (b) 341
(c) 338 (d) 350

SSC MTS 03/05/2023 (Shift IInd)

Ans. (c) : $(0.064)^{123} \div 0.16^{47} \times 0.4^{34} \times 0.4^{29} = (0.4)^{?}$

$(0.4^3)^{123} \div (0.4^2)^{47} \times 0.4^{34} \times 0.4^{29} = (0.4)^{?}$

$0.4^{369} \div 0.4^{94} \times 0.4^{34} \times 0.4^{29} = (0.4)^{?}$

$0.4^{275} \times 0.4^{34} \times 0.4^{29} = (0.4)^{?}$

On comparing powers-

$0.4^{338} = (0.4)^{?}$

$\therefore$? = 338

20. Which number can come in place of the question mark (?) in the following equation ?
$8^2 + 16^2 - 19^2 = ?^3 - 257$

(a) 6 (b) 8
(c) 9 (d) 2

SSC MTS 11/07/2022 (Shift-I)

Ans. (a) : $(8)^2 + (16)^2 - (19)^2 = (?)^3 - 257$

$64 + 256 - 361 = (?)^3 - 257$

$320 - 361 + 257 = (?)^3$

$577 - 361 = (?)^3$

$216 = (?)^3$

$(6)^3 = (?)^3$

Hence, ? = 6

21. Find the value of $16^2 - 256^{\frac{1}{4}} + 2197^{\frac{1}{3}}$

(a) 241 (b) 262
(c) 280 (d) 265

SSC MTS 08/07/2022 (Shift-I)

Ans. (d) : $16^2 - 256^{\frac{1}{4}} + 2197^{\frac{1}{3}}$

$= 256 - (4^4)^{\frac{1}{4}} + (13^3)^{\frac{1}{3}}$

$= 256 - 4 + 13 = 265$

22. What will be the value of $(256)^{\frac{1}{2}} - (1331)^{\frac{1}{3}} + 23\times 13$?

(a) 305 (b) 304
(c) 302 (d) 309

SSC MTS 15/07/2022 (Shift-I)

Ans. (b) : According to the question–

$=(256)^{\frac{1}{2}} - (1331)^{\frac{1}{3}} + 23\times 13$

$= (16^2)^{\frac{1}{2}} - (11^3)^{\frac{1}{3}} + 299$

$= 16-11+299 = 315-11 = 304$

23. Which number can come in place of the question mark (?) in the following equation ?

$\left(9^2\times 27+3^3\times 7+?\right)^{\frac{1}{2}}=59$

(a) 1111 (b) 1087
(c) 1105 (d) 1090

SSC MTS 26/07/2022 (Shift-I)

@apna_pdf

Ans. (c) : According to the question–

$(9^2 \times 27 + 3^3 \times 7 + ?)^{1/2} = 59$

$(81 \times 27 + 27 \times 7 + ?)^{1/2} = 59$

Squaring both side

$2187 + 189 + ? = 3481$

$? = 3481 - 2376$

$? = 1105$

24. Find the value of $\{(0.51)^3 + (0.49)^3\} \div \{(0.51)^2 - 0.2499 + (0.49)^2\}$.

(a) 1.57 (b) 3.31

(c) 2.9 (d) 1.00

SSC MTS 01/09/2023 (Shift Ist)

Ans. (d) : According to the question-

$\{(0.51)^3 + (0.49)^3\} \div \{(0.51)^2 - 0.2499 + (0.49)^2\}$

$\Rightarrow \dfrac{0.51\times0.51\times0.51+0.49\times0.49\times0.49}{0.51\times0.51-0.2499+0.49\times0.49}$

$\Rightarrow \dfrac{(0.51+0.49)(0.51\times0.51-0.2499+0.49\times0.49)}{(0.51\times0.51-0.2499+0.49\times0.49)}$

$= (0.51+0.49) = 1$

25. If a : b = b : c then what will be the value of $a^6 : b^6$?

(a) $b^3 = ac$ (b) $a^2 : b^2$

(c) $a^3 : c^3$ (d) $a^3 : b^3$

SSC MTS 15/07/2022 (Shift-III)

Ans. (c) : Given :

a : b = b : c

$\Rightarrow b^2 = ac$

Taking cube both sides

$\Rightarrow a^3 c^3 = b^6$ ......(i)

To calculate : $a^6 : b^6$

Put the value of b^6 from equation (i)

$\Rightarrow a^6 : a^3 : c^3$

$\Rightarrow a^3 : c^3$

Hence, option (c) is correct.

26. Solve the expression $((82 \times 82) - (18 \times 18))^{0.5}$.

(a) 20 (b) 100

(c) 80 (d) 40

SSC CHSL –02/06/2022 (Shift-I)

Ans. (c) : $((82 \times 82) - (18 \times 18))^{0.5}$

Concept used :

$(a + b) * (a - b) = a^2 - b^2$

$= \sqrt{(82\times82)-(18\times18)}$

$= \sqrt{(82)^2-(18)^2} = \sqrt{(82+18)(82-18)}$

$= \sqrt{(100)(64)} = 10 \times 8 = 80$

27. Which of the following statement is/are true?

I. $33^3 > 3^{33}$

II. $333 > (3^3)^3$

(a) Only I (b) Only II

(c) Both I and II (d) Neither I nor II

SSC CGL (Tier-II) 20/02/2018

SSC CPO SI 10/11/2022 (Shift IInd)

Ans. (d) : (I) $33^3 > 3^{33}$

$33 \times 33 \times 33 > 3^{11} \times 3^{11} \times 3^{11}$

$\because 3^{11} > 33$

Hence, this is false,

(II) $333 > (3^3)^3$

$333 > (27)^3$

$333 > 27 \times 27 \times 27$

Hence, this is false.

Hence, Neither statement I nor statement II is correct.

28. If $x^{y^z} = 1$, $y^{z^x} = 125$ and $z^{y^x} = 243$ (x, y and z are natural number), then what is the value of 9x+10y–18z ?

(a) 18 (b) 15

(c) 12 (d) 5

SSC CGL (Tier-II) 09/03/2018

SSC MTS 11/09/2023 (Shift IIst)

Ans. (d) : $x^{y^z} = 1$ ... (i)

If x = 1, then x^{y^z} remain 1.

$y^{z^x} = 125$ ... (ii)

by putting x = 1, y = 5, and z = 3

$5^{3^1} = 125$

Again,

$z^{y^x} = 243$ ... (iii)

$\therefore 3^{5^1} = 243$

$\therefore$ x = 1, y = 5, z = 3

Hence, 9x + 10y – 18z = 9 + 50 – 54 = 5

29. If $x^{y+z} = 1$, $y^{z+x} = 1024$ and $z^{x+y} = 729$ (x, y and z are natural number) then what is the value of $(z+1)^{y+x+1}$

(a) 6561 (b) 10000

(c) 4096 (d) 14641

SSC CPO SI 10/11/2022 (Shift IInd)

SSC CGL (Tier-II) 09/03/2018

Ans. (b) :

$x^{y+z} = 1$....... (i)

$y^{z+x} = 1024$

$y^{z+x} = 2^{10}$ .... (ii)

From equation (i) and (ii)

x = 1, y = 2, z = 9

$\therefore z^{x+y} = 9^3 = 729$

$(z+1)^{y+x+1} = 10^4 = 10000$

30. If $\dfrac{3^{a+3} \times 4^{a+6} \times 25^{a+1}}{27^{a-1} \times 8^{a-2} \times 125^{a+4}} = \dfrac{4}{15^{26}}$, then find the value of $\sqrt{a+9}$?

(a) 6 (b) 5

(c) 8 (d) 4

SSC CHSL 14/10/2020 (Shit-IInd)

SSC GD Constable 07/02/2023 (Shift Ist)

@apna_pdf

Ans. (b) : $\dfrac{3^{a+3}\times4^{a+6}\times25^{a+1}}{27^{a-1}\times8^{a-2}\times125^{a+4}}=\dfrac{4}{15^{26}}$

$\dfrac{3^{a+3}\times2^{2a+12}\times5^{2a+2}}{3^{3a-3}\times2^{3a-6}\times5^{3a+12}}=\dfrac{4}{15^{26}}$

$3^{-2a+6}\times2^{-a+18}\times5^{-a-10}=2^2\times3^{-26}\times5^{-26}$

On Comparing both side

$-a+18=2$

$a=16$

Hence, $\sqrt{a+9}=\sqrt{25}=5$

31. The value of $(0.3)^{\left[\{(200-146)/(3\times3\times3)\}-3\right]}$ is:

(a) C > B > A (b) C > A > B

(c) A > B > C (d) A > C > B

SSC CGL (Tier-II) 21-02-2018

Ans. (c) : Given

$A=2^{32}=4^{16}$ .... (i)

$B=2^{31}+2^{30}+2^{29}+....+2^0$

$B=2^0+2^1+.....+2^{29}+2^{30}+2^{31}$

∵ It is in G.P

$a=2^0=1$

$r=2,\ \ n=32$

$\therefore B=S_{32}=\dfrac{1(2^{32}-1)}{2-1}\quad\left\{\because S_n=\dfrac{a(r^n-1)}{r-1}\right\}$ When $r>1$

$B=(2^{32}-1)=4^{16}-1$ .... (ii)

$\because C=3^{15}+3^{14}+3^{13}+.......+3^0$

$C=3^0+3^1+.....+3^{13}+3^{14}+3^{15}$

∵ It is in G.P

$a=3^0=1,\ r=3,\ n=16$

$\therefore C=S_{16}=\dfrac{1(3^{16}-1)}{3-1}$

$C=\dfrac{3^{16}-1}{2}$..........(iii)

From Equation (i), (ii) and equation (iiI)

$\boxed{A>B>C}$

SSC CHSL 05/07/2019 (Shift-II)

Ans. (b) : $5^{\sqrt[3]{x}}+12^{\sqrt[3]{x}}=13^{\sqrt[3]{x}}$

From option (b)

On putting x = 8,

$5^2+12^2=13^2$

$25+144=169$

$169=169$

Hence the value of x will be 8.

ab = 25 – 24

$\Rightarrow$ ab = 1 .... (ii)

59. Which of the following statement(s) is/are TRUE ?

I. $\sqrt{(64)}+\sqrt{(0.0064)}+\sqrt{(0.81)}+\sqrt{(0.0081)} = 9.07$

II. $\sqrt{(0.010201)}+\sqrt{(98.01)}+\sqrt{(0.25)} = 11.51$

(a) Only I (b) Only II

(c) Both I and II (d) Neither I nor II

SSC CGL (Tier-II) 21-02-2018

Ans. (a) : From statement (I)

L.H.S. $= \sqrt{64}+\sqrt{0.0064}+\sqrt{0.81}+\sqrt{0.0081}$

From statement II

L.H.S. $= \sqrt{0.010201}+\sqrt{98.01}+\sqrt{0.25}$

= 10.501 $\neq$ R.H.S. (False)

So only statement I is correct.

60. Which of the following statement(s) is/are TRUE ?

I. $\frac{2}{3\sqrt{5}} < \frac{3}{2\sqrt{5}} < \frac{5}{4\sqrt{3}}$

II. $\frac{3}{2\sqrt{5}} < \frac{2}{3\sqrt{3}} < \frac{7}{4\sqrt{5}}$

(a) Only I (b) Only II

(c) Both I and II (d) Neither I nor II

SSC CGL (Tier-II) 20-02-2018

Ans. (a) :

From statement- I

$\frac{2}{3\sqrt{5}} < \frac{3}{2\sqrt{5}} < \frac{5}{4\sqrt{3}}$

@apna_pdf

L.C.M of $3\sqrt{5}, 2\sqrt{5}$ and $4\sqrt{3} = 12\sqrt{15}$

$8\sqrt{3} < 18\sqrt{3} < 15\sqrt{5}$ (Hence it is true)

From statement- II

$\frac{3}{2\sqrt{5}} < \frac{2}{3\sqrt{3}} < \frac{7}{4\sqrt{5}}$

L.C.M of $2\sqrt{5}$, $3\sqrt{3}$ and $4\sqrt{5} = 12\sqrt{15}$

$18\sqrt{3} < 8\sqrt{5} < 21\sqrt{3}$

$18\times1.7 < 8\times2.2 < 21\times1.7$ (Hence it is false)

Hence it is clear that only statement I is correct.

II. $\frac{1}{\sqrt[4]{29}} > \frac{1}{\sqrt[3]{12}} > \frac{1}{\sqrt{5}}$

(a) Only I (b) Only II
(c) Both I and II (d) Neither I nor II

SSC CGL (Tier-II) 20-02-2018

Ans. (a) :

From statement I

$\sqrt{11} + \sqrt{7} < \sqrt{10} + \sqrt{8}$

On squaring both sides

$18 + 2\sqrt{77} < 18 + 2\sqrt{80}$

This statement is true

From statement II

$\sqrt{17} + \sqrt{11} > \sqrt{15} + \sqrt{13}$

On squaring both sides

$28 + 2\sqrt{187} > 28 + 2\sqrt{195}$

So this statement is false

So only statement I is correct.

64. Which of the following statement(s) is/are TRUE ?

I. $\sqrt{12} > \sqrt[3]{16} > \sqrt[4]{24}$

II. $\sqrt[3]{25} > \sqrt[4]{32} > \sqrt[6]{48}$

(a) Only I and II (b) Only I and III
(c) Only I (d) All are true

SSC CGL (Tier-II) 20-02-2018

Ans. (a) :

From statement I

$\sqrt{12} > \sqrt[3]{16} > \sqrt[4]{24}$

or $12^{\frac{1}{2}} > 16^{\frac{1}{3}} > 24^{\frac{1}{4}}$

L.C.M of 2, 3 and 4 = 12

$12^6 > 16^4 > 24^3$

144×144×144>256×256>24×24×24

So it is clear that statement I is true.

From statement II

$\sqrt[3]{25} > \sqrt[4]{32} > \sqrt[6]{48}$

or $25^{\frac{1}{3}} > 32^{\frac{1}{4}} > 48^{\frac{1}{6}}$

L.C.M of 3, 4 and 6 = 12

$25^4 > 32^3 > 48^2$

So it is clear that statement II is true.

From statement III

$\sqrt[4]{9} > \sqrt[3]{15} > \sqrt[6]{24}$

or $9^{\frac{1}{4}} > 15^{\frac{1}{3}} > 24^{\frac{1}{6}}$

L.C.M of 3, 4 and 6 = 12

$9^3 > 15^4 > 24^2$

Statement III is false.

So it is clear that only statement I and II is true.

(a) 12346 (b) 12345
(c) 12344 (d) 12347

SSC CGL (Tier-II) 9-3-2018

Ans. (a) : N = $(12345)^2$ + 12345 + 12346
Let x = 12345

$\sqrt{N} = 12345+1 = 12346$

67. Which of the following statement(s) is/are TRUE ?

I. $\sqrt{121}+\sqrt{12321}+\sqrt{1234321} = 1233$

II. $\sqrt{0.64}+\sqrt{64}+\sqrt{36}+\sqrt{0.36} > 15$

(a) Only I (b) Only II

SSC CGL (Tier-II) 9-3-2018

Ans. (d) : From statement I
$\sqrt{121}+\sqrt{12321}+\sqrt{1234321} = 1233$
11 + 111 + 1111 = 1233
1233 = 1233
From statement II
$\sqrt{0.64}+\sqrt{64}+\sqrt{36}+\sqrt{0.36} > 15$

68. If $\sqrt{(1-p^2)(1-q^2)} = \frac{\sqrt{3}}{2}$, then what is the value of $\sqrt{2p^2+2q^2+2pq}+\sqrt{2p^2+2q^2-2pq}$?

(a) 2 (b) $\sqrt{2}$
(c) 1 (d) None of these

SSC CGL (Tier-II) 9-3-2018

Ans. (b) : Method-I

$\sqrt{(1-p^2)(1-q^2)} = \frac{\sqrt{3}}{2}$

On squaring both sides

$1-q^2-p^2+p^2q^2 = \frac{3}{4}$

$p^2+q^2 = \frac{1}{4}+p^2q^2$

$p^2+q^2+pq = \frac{1}{4}+p^2q^2+pq$

$= \left(\frac{1}{2}+pq\right)^2$

$\sqrt{p^2+q^2+pq} = \frac{1}{2}+pq$

Same as $\sqrt{p^2+q^2-pq} = \frac{1}{2}-pq$

Hence $\sqrt{2p^2+2q^2+2pq}+\sqrt{2p^2+2q^2-2pq}$

$\sqrt{2}\left[\frac{1}{2}+pq+\frac{1}{2}-pq\right]$

$= \sqrt{2}$

Method-II

There is 2 variable and 1 equation.

$\therefore$ From value putting,

p = 0

$\sqrt{(1-0)(1-q^2)} = \frac{\sqrt{3}}{2}$

$1-q^2 = \frac{3}{4}$

$q = \frac{1}{2}$

So, $\sqrt{0+2\times\frac{1}{4}+0}+\sqrt{0+2\times\frac{1}{4}-0}$

$= \frac{1}{\sqrt{2}}+\frac{1}{\sqrt{2}} = \sqrt{2}$

$=5\sqrt{3}+7\sqrt{2}-\sqrt{6}-5\sqrt{3}-7\sqrt{2}+12+\sqrt{6}$

$= 12$

84. The value of $\dfrac{1}{\left(9-4\sqrt{5}\right)^2}+\dfrac{1}{\left(9+4\sqrt{5}\right)^2}$ is:

(a) 289 (b) 322

(c) 424 (d) 246

SSC CHSL –13/10/2020 (Shift-I)

Ans. (b): $\dfrac{1}{\left(9-4\sqrt{5}\right)^2}+\dfrac{1}{\left(9+4\sqrt{5}\right)^2}$

$= \dfrac{\left(9-4\sqrt{5}\right)^2+\left(9+4\sqrt{5}\right)^2}{\left[(9)^2-\left(4\sqrt{5}\right)^2\right]^2}$

$= \dfrac{(9)^2+\left(4\sqrt{5}\right)^2-2\times9\times4\sqrt{5}+9^2+\left(4\sqrt{5}\right)^2+2\times9\times4\sqrt{5}}{[81-16\times5]^2}$

$= \dfrac{81+80+81+80}{[81-80]^2} = 322$

85. Find the value of x in $\sqrt[3]{15625}-\sqrt{x}=4$.

(a) 81 (b) 441

(c) 625 (d) 343

SSC CHSL –14/10/2020 (Shift-III)

Ans. (b) : $\sqrt[3]{15625}-\sqrt{x}=4$

$25-4 = \sqrt{x}$

$\sqrt{x} = 21$

$x = 441$

86. What is the value of $\sqrt[3]{340+\sqrt{9}}$?

(a) 9 (b) 7

(c) 5 (d) 19

SSC MTS 10-10-2017 (Shift-I)

Ans : (b) $\sqrt[3]{340+\sqrt{9}}$

$=\sqrt[3]{340+3}$

$=\sqrt[3]{343}$

$=\sqrt[3]{7\times7\times7}$

$= 7$

87. If $\dfrac{4}{1+\sqrt{2}+\sqrt{3}} = a+b\sqrt{2}+c\sqrt{3}-d\sqrt{6}$, where a, b, c, d are natural numbers, then the value of a + b + c + d is:

(a) 4 (b) 1

(c) 2 (d) 0

SSC CHSL –18/03/2020 (Shift-I)

Ans. (a) : $\dfrac{4}{1+\sqrt{2}+\sqrt{3}} = a+b\sqrt{2}+c\sqrt{3}-d\sqrt{6}$

$=\dfrac{4}{1+\left(\sqrt{2}+\sqrt{3}\right)}\times\dfrac{1-\left(\sqrt{2}+\sqrt{3}\right)}{1-\left(\sqrt{2}+\sqrt{3}\right)}$

$=\dfrac{4\left[1-\left(\sqrt{2}+\sqrt{3}\right)\right]}{1-\left(\sqrt{2}+\sqrt{3}\right)^2}$

$=\dfrac{4\left[1-\sqrt{2}-\sqrt{3}\right]}{1-\left(2+3+2\sqrt{6}\right)}$

$=\dfrac{4\left(1-\sqrt{2}-\sqrt{3}\right)}{-\left(4+2\sqrt{6}\right)}\times\dfrac{\left(4-2\sqrt{6}\right)}{\left(4-2\sqrt{6}\right)}$

$=\dfrac{4\left(1-\sqrt{2}-\sqrt{3}\right)\left(4-2\sqrt{6}\right)}{-(16-24)}$

$=\left(1-\sqrt{2}-\sqrt{3}\right)\left(2-\sqrt{6}\right)$

$=2-2\sqrt{2}-2\sqrt{3}-\sqrt{6}+2\sqrt{3}+3\sqrt{2}$

$\Rightarrow 2+\sqrt{2}-\sqrt{6} = a+b\sqrt{2}+c\sqrt{3}-d\sqrt{6}$

On comparing both sides

$a = 2, b = 1, c = 0, d = 1$

$\therefore a + b + c + d = 2 + 1 + 0 + 1 = 4$

88. If the value of $\dfrac{3x\sqrt{y}+2y\sqrt{x}}{3x\sqrt{y}-2y\sqrt{x}}-\dfrac{3x\sqrt{y}-2y\sqrt{x}}{3x\sqrt{y}+2y\sqrt{x}}$ is same as that of $\sqrt{x}\sqrt{y}$, then which of the following relations between x and y is correct?

@apna_pdf

(a) $9x + 4y = 36$
(b) $9x + 4y = 24$
(c) $9x - 4y = 36$
(d) $9x - 4y = 24$

SSC CHSL –18/03/2020 (Shift-I)

Ans. (d) : $\because \frac{a+b}{a-b} - \frac{a-b}{a+b} = \frac{4ab}{a^2-b^2}$

$\therefore \frac{3x\sqrt{y}+2y\sqrt{x}}{3x\sqrt{y}-2y\sqrt{x}} - \frac{3x\sqrt{y}-2y\sqrt{x}}{3x\sqrt{y}+2y\sqrt{x}} = \frac{4\times 3x\sqrt{y}\times 2y\sqrt{x}}{\left(3x\sqrt{y}\right)^2-\left(2y\sqrt{x}\right)^2}$

According to the question, $\frac{24xy\sqrt{x}.\sqrt{y}}{9x^2y-4y^2x} = \sqrt{x}.\sqrt{y}$

$\Rightarrow \frac{24xy}{xy(9x-4y)} = 1$

$\Rightarrow 24 = 9x - 4y$

$\Rightarrow 9x - 4y = 24$

89. If $\sqrt{x} = \sqrt{3} - \sqrt{5}$, then the value of $x^2 - 16x + 6$ is:

(a) –2
(b) 2
(c) 0
(d) 4

SSC CHSL –21/10/2020 (Shift-II)

Ans. (b) $\sqrt{x} = \sqrt{3} - \sqrt{5}$

Taking square both sides

$x = 3 + 5 - 2\sqrt{15}$

$x - 8 = -2\sqrt{15}$

Again, taking square both sides

$(x-8)^2 = (-2\sqrt{15})^2$

$x^2 + 64 - 16x = 60$

$x^2 - 16x + 4 = 0$

On adding 2 both sides

$x^2 - 16x + 4 + 2 = 2$

$\boxed{x^2 - 16x + 6 = 2}$

90. What is the value of $\left(\sqrt{5}-\sqrt{3}\right) \div \left(\sqrt{5}+\sqrt{3}\right) = ?$

(a) $4-\sqrt{15}$
(b) $6-2\sqrt{15}$
(c) $8-2\sqrt{15}$
(d) $4+\sqrt{15}$

SSC MTS 10-10-2017 (Shift-III)

Ans. (a) : $\left(\sqrt{5}-\sqrt{3}\right) \div \left(\sqrt{5}+\sqrt{3}\right) = ?$

$= \frac{\left(\sqrt{5}-\sqrt{3}\right)}{\left(\sqrt{5}+\sqrt{3}\right)}$

On rationalization

$= \frac{\sqrt{5}-\sqrt{3}}{\sqrt{5}+\sqrt{3}} \times \frac{\sqrt{5}-\sqrt{3}}{\sqrt{5}-\sqrt{3}}$

$= \frac{\left(\sqrt{5}-\sqrt{3}\right)^2}{\left(\sqrt{5}\right)^2-\left(\sqrt{3}\right)^2}$

$= \frac{5+3-2\sqrt{15}}{5-3}$

$= \frac{8-2\sqrt{15}}{2} = 4-\sqrt{15}$

(IV) Miscellaneous

91. What of the following statements is/are true?
I. $(0.7)^2 + (0.07)^2 + (11.1)^2 > 123.8$
II. $(1.12)^2 + (10.3)^2 + (1.05)^2 > 108.3$

(a) Only I
(b) Only II
(c) Both I and II
(d) Neither I nor II

SSC CPO SI 9/11/2022 (Shift I[st])

Ans. (b) : From statement I

$(0.7)^2 + (0.07)^2 + (11.1)^2 > 123.8$

$0.49 + 0.0049 + 123.21 > 123.8$

$123.7049 > 123.8$ (False)

From statement II

$(1.12)^2 + (10.3)^2 + (1.05)^2 > 108.3$

$1.2544 + 106.09 + 1.1025 > 108.3$

$108.4469 > 108.3$ (True)

Hence, it is clear that only statement II is true.

92. Which of the following statement(s) is/are TRUE ?
I. $(0.7)^2 + (0.07)^2 + (11.1)^2 > 123.8$
II. $(1.12)^2 + (10.3)^2 + (1.05)^2 > 108.3$

(a) Only I
(b) Only II
(c) Both I and II
(d) Neither I nor II

SSC CGL (Tier-II) 21-02-2018

Ans. (b) : From statement I

$(0.7)^2 + (0.07)^2 + (11.1)^2 > 123.8$

$0.49 + 0.0049 + 123.21 > 123.8$

$\Rightarrow 123.7049 > 123.8$ (False)

From statement II

$(1.12)^2 + (10.3)^2 + (1.05)^2 > 108.3$

$\Rightarrow 1.2544 + 106.09 + 1.1025 > 108.3$

$\Rightarrow 108.4469 > 108.3$ (True)

So only statement II is true.

93. If $P = 2^{29} \times 3^{21} \times 5^8$, $Q = 2^{27} \times 3^{21} \times 5^8$, $R = 2^{26} \times 3^{22} \times 5^8$ and $S = 2^{25} \times 3^{22} \times 5^9$, then which of the following is TRUE?

(a) $P > S > R > Q$
(b) $S > P > R > Q$
(c) $P > R > S > Q$
(d) $S > P > Q > R$

SSC CGL (Tier-II) 9-3-2018

Ans. (a) : $P = 2^{29} \times 3^{21} \times 5^8 = 2^{25} \times 3^{21} \times 5^8 \times \boxed{16}$

$Q = 2^{27} \times 3^{21} \times 5^8 = 2^{25} \times 3^{21} \times 5^8 \times \boxed{4}$

$R = 2^{26} \times 3^{22} \times 5^8 = 2^{25} \times 3^{21} \times 5^8 \times \boxed{6}$

$S = 2^{25} \times 3^{22} \times 5^9 = 2^{25} \times 3^{21} \times 5^8 \times \boxed{15}$

$\therefore P > S > R > Q$

1. Two persons take steps of 77 cm and 88 cm respectively. If they both start walking together taking steps. Then what is the minimum distance (in cm) they should cover so that both of them become in step again (covering the distance in whole steps)?

(a) 616 (b) 968
(c) 828 (d) 560

SSC MTS 01/09/2023 (Shift-I)

Ans. (a) : According to the question,
Minimum covered distance when both of them become in step again.
= LCM of 77 and 88
= 616 cm

2. Find the LCM of $\frac{1}{6},\frac{5}{27},\frac{4}{15},\frac{8}{3}$?

(a) $\frac{40}{3}$ (b) $\frac{40}{5}$ (c) $\frac{5}{28}$ (d) $\frac{3}{28}$

SSC MTS 08/09/2023 (Shift-III)

Ans. (a) : LCM of $\frac{1}{6},\frac{5}{27},\frac{4}{15},\frac{8}{3}$

$= \frac{\text{LCM of } 1,5,4,8}{\text{HCF of } 6,27,15,3}$

$= \frac{40}{3}$

3. Find the smallest 3 digit number which when added to 5 is exactly divisible by 12, 14 and 18.

(a) 240 (b) 225
(c) 247 (d) 245

SSC MTS 14/09/2023 (Shift-II)

Ans. (c) ∵ The smallest number which is completely divisible by 12, 14 and 18 = The LCM of 12, 14, 18.
12 = 2 × 2 × 3
14 = 2 × 7
18 = 2 × 3 × 3
LCM = 2×2×3×3×7 = 252
Hence, the required number = 252 – 5 = 247

4. Six bells commence tolling together at 7 : 59 am. They toll at intervals of 3, 6, 9, 12 and 15 seconds respectively. How many times will they toll together till 8 : 16 am ? (excluding the toll at 7 : 59 am)

(a) 4 (b) 3
(c) 5 (d) 6

SSC MTS 08/05/2023 (Shift IInd)

Ans. (c) : According to the question,
LCM of 3, 6, 9, 12 and 15 = 180 seconds
Required number of times in 17 minutes (17 × 60 second)

Number of times they toll together $= \frac{17\times60}{180}$ = 5.7~5

This is approximated as 5 bells will not toll in fractions and it will take some more time to bell 6th ring.

SSC MTS 08/07/2022 (Shift-I)

Ans. (a) : Given

Ans.(d):

3	63,	91,	133
3	21,	91,	133
7	7,	91,	133
13	1,	13,	19
19	1,	1,	19,
	1,	1,	1

LCM = 3×3×7×13×19 =15561

(a) $2^6 \times 3^7$ (b) $2^7 \times 3^7$
(c) $2^9 \times 3^7$ (d) $2^8 \times 3^7$

SSC MTS 12/07/2022 (Shift-III)

Ans. (d) : $A = 2^3 \times 3^7$, $B = 2^7 \times 3^5$, $C = 2^8 \times 3^4$
Least common multiple (LCM) of A, B and C = $2^8 \times 3^7$

9. What is the least common multiple (LCM) of fraction (2/3), (8/15) and (4/27)?
(a) 3/8 (b) 12/5
(c) 8/3 (d) 24/7

SSC MTS 08/05/2023 (Shift IInd)

Ans. (c) : LCM of fraction $\left[\frac{2}{3}, \frac{8}{15}, \frac{4}{27}\right]$

$$= \frac{\text{LCM of } 2,8,4}{\text{HCF of } 3,15,27} = \frac{8}{3}$$

Hence LCM of fraction $= \frac{8}{3}$

10. What is the least common multiple (LCM) of $\frac{3}{8}, \frac{5}{16}$ and $\frac{7}{2}$?
(a) $52\frac{1}{2}$ (b) $101\frac{1}{2}$ (c) $25\frac{1}{4}$ (d) $28\frac{1}{4}$

SSC CGL 09/12/2022 (Shift-IV)

Ans. (a) : According to the question,
LCM of $\frac{3}{8}, \frac{5}{16}$ and $\frac{7}{2} = \frac{\text{LCM of } 3,5 \text{ and } 7}{\text{HCF of } 8,16 \text{ and } 2} = \frac{105}{2} = 52\frac{1}{2}$

3	1, 17, 21
7	1, 17, 7
17	1, 17, 1
	1, 1, 1

Hence, LCM of 96, 136 and 504
$= 2\times2\times2\times2\times2\times3\times3\times7\times17 = 34272$

12. Find the least common multiple of 1.2 and 2.7?
(a) 5.4 (b) 10.8
(c) 32.4 (d) 7.08

SSC CGL 12/12/2022 (Shift-II)

Ans. (b) : $1.2, 2.7 = \frac{12}{10}, \frac{27}{10}$

LCM of fraction $= \frac{\text{LCM of Numerator}}{\text{HCF of Denominator}}$

$\therefore$ LCM of $\frac{12}{10}, \frac{27}{10} = \frac{108}{10} = 10{\cdot}8$

(a) 1 (b) 3
(c) 4 (d) 2

SSC CGL (Mains) 02/03/2023

Ans. (d) : L×H = First number × Second number
L×10 = 1500 {L = LCM, H = HCF}
L = 150 = 10×3×5 = Hab
$\therefore$ ab = 3×5 and 1×15
Hence number of possible pairs is 2.

14. Find the largest three digit number which when divided by 3, 5 and 9 gives the same remainder 2.
(a) 984 (b) 998
(c) 999 (d) 992

SSC CGL Mains (Tier-II) 07/03/2022

Ans. (d): LCM of 3, 5 and 9 = 45
Required number = 45K + 2
The largest number of three digit = 999

45)999(22
90
×99

Hence, required number = (999 - 9) + 2 = 992

15. What is the least common multiple (LCM) of $x^2 - 8x + 15$ and $x^2 - 5x + 6$?
(a) $(x-6)^2(x+1)(x-3)$ (b) $(x+6)(x+1)(x-3)$
(c) $(x-6)(x+1)(x-3)$ (d) $(x-2)(x-3)(x-5)$

$\frac{3600}{1000}, \frac{1800}{1000}, \frac{144}{1000}$

LCM of fraction $= \frac{\text{LCM of numerator}}{\text{HCF of denominator}} = \frac{3600}{1000} = 3.6$

@apna_pdf

Ans. (c) : Least required number

$= (\text{LCM of } 15, 18, 36)\ x + 9 = 180\ x + 9$

$x + 9 = 180x + 9$

On putting the value of x = 1, 2, 3,............

$\because$ (180x + 9), is divisible by 11.

$\therefore$ On taking x = 6

Number $= 180\times6 + 9 = 1089$

The sum of digit of number $= 1+0+8+9$

$= \boxed{18}$

18. LCM of two prime numbers x and y (x > y) is 253. The difference between the number x and y is:

(a) 11 (b) 14
(c) 12 (d) 16

SSC GD Constable 06/02/2023 (Shift IIIrd)

Ans. (c) : Only 11 and 23 are the prime factor of 253.
So we can say that LCM of 11 and 23 will be 253.

$253 = 11 \times 23$

$\Rightarrow x = 23$ and $y = 11$ ($\because x > y$)

Hence, $x - y = 23 - 11 = 12$.

19. There is a number greater than 1 which when divided by 4, 5 and 6 leaves the same remainder 3 in each case. Find the largest number, smaller than 500 which satisfies the given condition.

3	1, 5, 3
5	1, 5, 1
	1, 1, 1

60)500(8
480

25. A and B are two prime numbers such that A > B and their LCM is 209. The value of $A^2 – B$ is:
(a) 350 (b) 372
(c) 361 (d) 339
SSC CGL (Tier-I) 12/04/2022 (Shift-III)

Ans.(a) Given that –
Two prime number = A, B
LCM of number = 209
According to the question,
∵ HCF of two prime number = 1
∴ Product of number = LCM × HCF
⇒ A × B = 209 ×1
⇒ A × B = 19 × 11
Where, A = 19 {∵ A > B }
B = 11
$\therefore A^2 - B = 19^2 - 11$
= 361 – 11
= 350
Hence, option (a) is correct.

58. **If the Highest Common Factor (HCF)of x and y is 15, then the HCF of $36x^2 - 81y^2$ and $81x^2 - 9y^2$ will be divisible by ______.**

(a) 180 (b) 135 (c) 90 (d) 120

SSC CGL (Mains) 06/03/2023

Ans. (b) : HCF of x and y is 15.

x = 15a

y = 15b

I:- $36x^2 - 81y^2 = 9(4x^2 - 9y^2) = 9[(2x)^2 - (3y)^2]$

$= 9(2x - 3y)(2x + 3y)$

II:- $81x^2 - 9y^2 = 9(9x^2 - y^2) = 9[(3x)^2 - (y)^2]$

$= 9(3x - y)(3x + y)$

HCF = 15 × 9 = 135

Hence, HCF is divisible by 135.

Q =2×2×2×3×3×3×3

R = 3×3×3×3×3×2×2×2×2×2×2×2

Hence the HCF = $2^3 \times 3^4$

(a) $(4^{25} - 1)$ (b) 1023

(c) 1024 (d) 1

SSC MTS 26/07/2022 (Shift-I)

Ans. (b) : $(4^{315} - 1) = (4^5)^{63} - (1)^{63}$

$(4^{25} - 1) = (4^5)^5 - (1)^5$

Hence, required HCF = $4^5 - 1$

= 1024 – 1

= 1023

63. **Find the greatest number that exactly divides 2880, 6525 and 8307.**

(a) 3 (b) 7

(c) 9 (d) 11

SSC GD Constable 02/02/2023 (Shift IInd)

Ans. (c) : HCF of 2880,6525 and 8307

2880 = 2 × 2 × 2 × 2 × 2 × 2 × 3 × 3 × 5

6525 = 3 × 3 × 5 × 5 × 29

8307 = 3 × 3 × 13 × 71

HCF = 3 × 3 = 9

Hence, required number = 9

64. **If (x – 3) is the HCF of $x^2 - 5x + 6$ and $x^2 + mx + 12$, then what is the value of m?**

(a) –7 (b) –2

(c) 2 (d) –1

SSC GD Constable 09/02/2023 (Shift IIIrd)

Ans. (a) : Given,

HCF of $x^2 - 5x + 6$ and $x^2 + mx + 12 = (x-3)$

So, $(x^2 + mx + 12)$ is divisible by (x – 3)

∴ x – 3 = 0

x = 3

Now,

$x^2 + mx + 12 = 0$

$(3)^2 + 3m + 12 = 0$

9 + 3m + 12 = 0

m = –7

Hence, it is clear that if HCF is (x – 3) then the value of 'm' will be '–7'.

               1317
                  0

HCF of numbers = 439

Hence, the Product of digits of x = 4 × 3 × 9 = 108

(a) 900 (b) 180
(c) 625 (d) 400

SSC CPO-SI 24/11/2020 (Shift-II)

Ans. (a) :

2	10, 12, 15, 18, 20
2	5, 6, 15, 9, 10
3	5, 3, 15, 9, 5
3	5, 1, 5, 3, 5
5	5, 1, 5, 1, 5
	1, 1, 1, 1, 1

Hence, LCM (12, 10, 15, 18, 20) = 180
Since LCM = 180 is not a perfect square, we make it a perfect square by multiplying 5 (which is the least value to be multiplied)
Then, 180 × 5 = 900 = 30^2
Therefore, 900 soldier can be drawn up in the form of a square.

SSC MTS 04/05/2023 (Shift Ist)

Ans.(c) : Let first number is x and second number is y.
HCF = 5
LCM = 120
Product of numbers = LCM × HCF
xy = 120 × 5
xy = 600 ...(i)
Sum of both numbers = 55
x + y = 55 ...(ii)
$(x - y)^2 = (x + y)^2 - 4xy$
$(x - y)^2 = (55)^2 - 4 (600)$ {From equation (i)}
$(x - y)^2 = 3025 - 2400$
$(x - y)^2 = 625$
x – y = 25 ...(iii)
The value of x and y from equation (ii) and (iii)

The sum of reciprocals of numbers $= \frac{1}{40} + \frac{1}{15} = \frac{3+8}{120}$

$= \frac{11}{120}$

II Method
Let both numbers are 5x and 5y.

120 = 5xy ⇒ xy =24
5x + 5y = 55
or x + y = 11

$\frac{1}{5x} + \frac{1}{5y} = \frac{x+y}{5xy} = \frac{11}{5 \times 24} = \boxed{\frac{11}{120}}$

96. The Product of the LCM and the HCF of two numbers is 216. The difference between the two numbers is 6. What are the numbers?

(a) 9, 24 (b) 6, 36
(c) 8, 27 (d) 12, 18

SSC MTS 07/07/2022 (Shift-II)

Ans. (d) : Let first number = x
Second number = (x + 6)
According to the question,
First number × second number = LCM × HCF

@apnipdf

$x \times (x + 6) = 216$
$x^2 + 6x - 216 = 0$
$x^2 - 12x + 18x - 216 = 0$
$x(x - 12) + 18(x - 12) = 0$
$(x-12)(x+18) = 0$
$\Rightarrow \quad x = 12$
Hence, first number = x = 12
Second number = x + 6 = 12 + 6 = 18

Possible value of K $= 3^4, 3^4 \times 2, 3^4 \times 2^2, 3^4 \times 2^3, 3^4 \times 2^4, 3^4 \times 2^5, 3^4 \times 2^6$

Hence it is clear that possible value of k is 7

129. Suppose that x and y be such 3 digit numbers such that their difference is 729 and H.C.F. is 81 then what is the value of x + y?

(a) 1053 (b) 891

(c) 1539 (d) 1377

SSC MTS 20/08/2019 (Shift-I)

Ans. (a) : x – y = 729

x – y = 81 × 9 (81 HCF) ———(1)

Let

x = 81 × A

y = 81 × B

x – y = 81 × 9

81A – 81 × B = 81 × 9

81 (A – B) = 81 × 9

A – B = 9

For the 3-digit number

Case : 1 81A < 1000

$A < \frac{1000}{81}$

$A < 12.34$

$A = 12, 11, 10$

Case : 2 81B > 100

$B > \frac{100}{81}$

B > 1.23

B > 2, 3

On putting A = 11

81 A = 81 × 11 = 891

On putting B = 2

81B = 81×2 =162

(x + y) = (891 + 162)

x + y = $\boxed{1053}$

130. Let x be the number divisible by 16,24,30,36 and 45, and x is also a perfect square. What is the remainder when x is divided by 123?

2	8, 12, 15, 18, 45
2	4, 6, 15, 9, 45

3	1, 1, 5, 3, 15
5	1, 1, 5, 1, 5
	1, 1, 1, 1, 1

Perfect square number (x) = 2×2×2×2×3×3×5×5 = 3600

The remainder obtained after dividing 3600 by 123 = 33

131. Two numbers are in the ratio 7:11. If their HCF is 28, then the difference between the two numbers is :

(a) 112 (b) 28
(c) 196 (d) 308

SSC CPO-SI 23/11/2020 (Shift-I)

Ans. (a) : Let the numbers be x and y.
The ratio of the numbers is 7 : 11
Hence, x : y = 7 : 11
The HCF of x and y is 28
Hence, the first number = 28 × 7
= 196
Second number = 28 × 11
= 308
Difference between both numbers = 308–196 = 112

132. What is the sum of the greatest three digit number and the smallest four digit number such that their HCF is 23?

(a) 1998 (b) 1984
(c) 2002 (d) 2001

SSC CPO-SI – 12/12/2019 (Shift-II)

Ans. (d) : The H.C.F of both the numbers is 23 So, both the numbers will be divisible by 23.
The greatest 3-digits number which is divisible by 23
= 989
The smallest 4-digits number which is divisible by 23
= 1012
Sum of both numbers = 989 + 1012
= 2001

133. The sum of two numbers is 1215 and their HCF is 81. If the numbers lie between 500 and 700, then the sum of the reciprocals of the numbers is?

(a) $\frac{5}{1512}$ (b) $\frac{5}{378}$
(c) $\frac{5}{1188}$ (d) $\frac{5}{702}$

SSC CPO-SI 13/12/2019 (Shift-II)

Ans. (a) HCF of the numbers = 81
Hence, the number divisible by 81 between 500 and 700
= 567 and 648
⇒ 567 + 648 = 1215

Sum of the reciprocals of the number $= \frac{1}{567}+\frac{1}{648}$

$= \frac{648+567}{567\times648}$

$= \frac{1215}{367416} = \frac{5}{1512}$

134. The HCF and LCM of two numbers p and q are A and B respectively. If A + B = p + q, then the value of $A^3 + B^3$ is :

(a) p^3 (b) q^3
(c) $p^3 + q^3$ (d) $p^3 - q^3$

SSC MTS 09/08/2019 (Shift-III)

Ans. (c) : A . B = p . q
A + B = p + q
On cubing both sides,
$A^3 + B^3 + 3AB\,(A+B) = p^3 + q^3 + 3pq\,(p + q)$
$A^3 + B^3 + 3pq\,(p+q) = p^3 + q^3 + 3pq\,(p+q)$
$A^3 + B^3 = p^3 + q^3$

135. A temple has five bells which ring at the intervals of 12, 15, 16, 20 and 25 minutes respectively. If they ring together at midnight, then at what time next will they ring together?

(a) 8:00 P.M. (b) 7:00 P.M.
(c) 7:30 P.M. (d) 8:30 P.M.

SSC MTS 16/08/2019 (Shift-I)

Ans. (a) : LCM of 12, 15, 16, 20, 25,
LCM = 16×3×5×5 min
= 48 × 25
= 1200 min
⇒ $\frac{1200}{60}$ hr = 20hr
Time of next ring = 12 : 00 : 00 AM (mid night) + 20 hr
= 8:00 PM

136. Which of the following statement(s) is/are TRUE ?
I. Highest common factor of $(3^{2002}-1)$ and $(3^{2002} + 1)$ is 4.
II. $(4^{84}-1)$ is exactly divisible by 5

(a) Only I (b) Only II
(c) Neither I nor II (d) Both I and II

SSC CGL (Tier-II) 9-3-2018

Ans. (b) : (I).
$3^{2002} - 1 = (3^{1001} + 1)\,(3^{1001} - 1)$
Hence the H.C.F of $(3^{2002}-1)$ and $(3^{2002}+1)$ is not 4.
(II). $4^{84} - 1 = (4^{42}+1)\,(4^{42}-1)$
$= (4^{42}+1)\,(4^{14}-1)\,(4^{28}+1+4^{14})$
$= (4^{42}+1)\,(4^{28}+1+4^{14})\,(4^{7}+1)\,(4^{7}-1)$
$= (4^{42}+1)\,(4^{28}+1+4^{14})\,(4^{7}-1) \times 16385$
$(4^{84}-1)$, is exactly divisible by 5.

$a^2+b^2+c^2=9$,

$ab+bc+ca=8$

$$(a+b+c)=\sqrt{(a+b+c)^2}$$

$$=\sqrt{(a^2+b^2+c^2)+2(ab+bc+ca)}$$

$$=\sqrt{9+2\times8}=\sqrt{25}$$

$$=5$$

$\therefore (a+b+c)-3=5-3=2$

$$4a+\frac{5}{a}=14-5$$

$$4a+\frac{5}{a}=9$$

On squaring both side −

$$16a^2+\frac{25}{a^2}+2\times4a\times\frac{5}{a}=81$$

$$16a^2+\frac{25}{a^2}+\frac{40a}{a}=81$$

$$16a^2+\frac{25}{a^2}=81-40$$

$$16a^2+\frac{25}{a^2}=41$$

81. **If $x^2 + y^2 + z^2 = xy + yz + zx$ and $x = 1$ find the value of $\frac{10x^4+5y^4+7z^4}{13x^2y^2+6y^2z^2+3z^2x^2}$**

(a) 0 (b) – 1 (c) 2 (d) 1

SSC CGL 05/12/2022 (Shift-IV)

Ans. (d) : Given,

$x^2 + y^2 + z^2 = xy + yz + zx$ और $x = 1$ है, तो

$\frac{10x^4+5y^4+7z^4}{13x^2y^2+6y^2z^2+3z^2x^2}$

According to question,

$x = y = z = 1$

$\Rightarrow x^2 + y^2 + z^2 = xy + yz + zx$

$\Rightarrow (1)^2 + (1)^2 + (1)^2 = 1 \times 1 + 1 \times 1 + 1 \times 1$

$\Rightarrow 3 = 3$

LHS = RHS

So $\frac{10x^4+5y^4+7z^4}{13x^2y^2+6y^2z^2+3z^2x^2}$

$\Rightarrow \frac{10\times(1)^4+5\times(1)^4+7\times(1)^4}{13\times1\times1+6\times1\times1+3\times1\times1}$

$\Rightarrow \frac{10+5+7}{13+6+3}$

$\Rightarrow \frac{22}{22} \Rightarrow 1$

SSC CGL 06/12/2022 (Shift-IV)

Ans. (a) : Given - $mx^m - nx^n = 0$

$= mx^m = nx^n$

$= \boxed{x^m = \frac{nx^n}{m}}$

$= \frac{1}{x^m+x^n}+\frac{1}{x^m-x^n}$

put the value of x^m in the question -

$= \frac{1}{\frac{nx^n}{m}+x^n}+\frac{1}{\frac{nx^n}{m}-x^n}$

$= \frac{m}{x^n(m+n)}+\frac{m}{x^n(n-m)}$

$= \frac{m}{x^n}\left[\frac{n-m+m+n}{n^2-m^2}\right]$

$= \boxed{\frac{2mn}{x^n\left(n^2-m^2\right)}}$

(a) –2 (b) 2 (c) 1 (d) 0

SSC GD Constable 07/02/2023 (Shift I[st])

Ans. (b) : $x+\frac{1}{x}=2$

$x^2 - 2x + 1 = 0$

$(x-1)^2 = 0$

$x = 1$

So $x^{57}+\frac{1}{x^{57}}$

$= 1^{57}+\frac{1}{1^{57}} = 1 + 1$

$= 2$

(c) $\frac{496}{125}$ (d) $\frac{125}{532}$

SSC CGL 06/12/2022 (Shift-IV)

Ans. (b) : $5x^2+7x+5=0$

On dividing both sides by x

$\Rightarrow \frac{5x^2}{x}+\frac{7x}{x}+\frac{5}{x}=0$

$\Rightarrow 5x+7+\frac{5}{x}=0$

$\Rightarrow 5x+\frac{5}{x}=-7$

$\Rightarrow 5\left(x+\frac{1}{x}\right)=-7$

$\Rightarrow \boxed{x+\frac{1}{x}=\frac{-7}{5}}$

Cubing both sides-

$\Rightarrow \left(x+\frac{1}{x}\right)^3=\left(\frac{-7}{5}\right)^3$

$\Rightarrow x^3+\frac{1}{x^3}+3\left(x+\frac{1}{x}\right)=\frac{-343}{125}$

$\Rightarrow x^3+\frac{1}{x^3}+3\times\frac{-7}{5}=\frac{-343}{125}$

$\Rightarrow x^3+\frac{1}{x^3}=\frac{-343}{125}+\frac{21}{5}$

$\Rightarrow x^3+\frac{1}{x^3}=\frac{-343+525}{125}$

$\Rightarrow x^3+\frac{1}{x^3}=\frac{182}{125}$
